The output measure is computed from the annual barrel-mile total of crude oil and products. All basic output data are published by the Interstate Commerce Commission. The index series refers to output per employee (production and nonproduction workers). Prior to 1958 man-hour data are not available. However, from 1958 forward, output per man-hour measures are available and are published in the source cited. All employment measures are computed by BLS.

W 64. Index of output per man-hour in railroad transportation, 1916–1970.

Source: U.S. Bureau of Labor Statistics, 1939, 1947–1970, *Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition*, Bulletin No. 1780; all other years, BLS computations (1916–1935, based on Witt Bowden, "Productivity, Hours, and Compensation of Rail-

road Labor, 1933–1936," *Monthly Labor Review*, July 1937; 1935–1947, based on BLS, *Trends in Output Per Man-Hour, 1935–1955, Selected Nonmanufacturing Industries*, Report No. 105, June 1956).

The index of output per man-hour for railroad transportation refers to Class I railroads and Class I switching and terminal companies. For 1935–1970, the production measure represents aggregate passenger-miles and freight ton-miles, each category being weighted by fixed period average unit revenue weights. The man-hours index represents straight time worked and overtime paid for all employees (production and nonproduction workers) and also includes constructive allowance hours of train and engine employees. Constructive allowance time includes vacations, standby time, held-over time, court time, etc. All basic data are published by the Interstate Commerce Commission.

The indexes for 1916–1934 are based on a somewhat different index prepared by BLS. The components of the production index are combined with 1926 weights; and for 1916 through July 1921, the man-hours represent time worked rather than paid.

W 65. Index of output per man-hour in the gas and electric utilities industry, 1939–70.

Source: U.S. Bureau of Labor Statistics, *Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition*, Bulletin No. 1780.

Output is measured in terms of energy sold (kw.-hr. of electricity and therms of gas) by privately owned gas utilities, privately owned classes A and B electric utilities, and REA borrowers. Unit revenue weights are used to combine the different output series. The index series refers to output per man-hour for all employees (both production and nonproduction workers). Employment and man-hour data are from BLS.

W 66. Indexes of output per man-hour for nonfinancial corporations, 1948–1970.

Source: U.S. Bureau of Labor Statistics, *Productivity, Wages, Prices, and Employment*, press release issued quarterly, table 4.

The nonfinancial corporate sector includes all corporations operating in the United States except banks, commodity and stock brokers, credit agencies, and insurance carriers. Output data used to prepare these indexes are the gross product originating in 1958 dollars. These data and compensation (wages, salaries, and supplements) were developed by the Bureau of Economic Analysis. A description of the methods and procedures used to derive these statistics appears in the May 1967 issue of *Survey of Current Business*.

Man-hours refer to hours paid and are based mainly on BLS establishment data on employment and average weekly hours. Census data by legal form of organization for 2-digit SIC industries are used to adjust man-hours to the nonfinancial corporate levels.

W 67–81. Index of farm production per man-hour, 1910–1970.

Source: U.S. Department of Agriculture, Economic Research Service, *Changes in Farm Production and Efficiency*, Statistical Bulletin No. 233.

For a description of the index of farm production, see the text for series K 414–429. The index of farm production per man-hour is the ratio of farm production to labor input. The index numbers are developed by relating the indexes of farm output and production of individual or groups of farm products to the appropriate index of labor input expressed in man-hours (see text for series K 410–413).

Indexes of farm labor productivity reflect the net effect of all factors that affect either farm production or the labor input. Since labor is one of the more important inputs in agricultural production, changes in the ratio of production to labor provide a useful measure of changes in efficiency of farm production.

These series are published annually in the source cited and in *Agricultural Statistics*.

Caution should be exercised when comparing the ERS series with those of the Bureau of Labor Statistics (BLS) because of differences between "gross" and "net" farm production, and between hours "worked" and hours "required."

BLS computes indexes of production per man-hour for the total private economy, for nonagriculture, and for agriculture. Like the ERS series, the BLS series calculates indexes of farm production in which production data are weighted by constant prices. However, the ERS farm output index is a "gross" index while the production index of BLS follows the GNP approach, which is a "net" index excluding intermediate products.

The BLS series uses both BLS and census labor force data based on hours "worked" and covers men, women, and children over 14 years of age. Thus, the labor input differs from the ERS series which reports hours "required" for agricultural production in terms of man-equivalent hours.

The BLS series is applicable for all agriculture only, while the ERS series permits comparisons.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

Chapter W

Copyrights, Patents, and Trademarks (Series W 82-108)

W 82–95. Copyright registrations, by type, 1870–1970.

Source: **Series W 82–91, W 93–95,** U.S. Library of Congress, *Annual Report of the Librarian of Congress* and *Annual Report of the Register of Copyrights*, various issues. **Series W 92,** U.S. Patent Office, 1874–1896, *Annual Report of the Commissioner of Patents*; 1897–1940, unpublished data; 1941–1970, U.S. Library of Congress, *Annual Report of the Librarian of Congress*, various issues.

Additional detail for some series is shown in the source volumes.

Figures are on a calendar-year basis for 1870–1896, and on a fiscal-year basis thereafter. Prior to 1870, copyright claims were entered at Federal District Courts. For additional information on this period, see Martin A. Roberts, *Records in the Copyright Office Deposited by the United States District Courts Covering the Period 1790–1870*, Washington, D.C., 1939.

The term "copyright" may be defined as the right to prevent copying. It has come to mean that body of exclusive rights granted by Federal statute to authors for the protection of their writings. It includes the exclusive right to print, reprint, publish, copy, and vend the copyrighted work; to make other versions of the work; and, with certain limitations, to make recordings of the work and to perform the work in public. The Copyright Office is primarily an office of record, and registers claims if the provisions of the law and the regulations have been complied with. A certificate is issued to the applicant upon completion of each registration.

The first law, 1790, applied only to maps, charts, and books. Subsequent amendments provided for prints (1802); musical compositions (1831); dramatic compositions with the right of public performance (1856); photographs (1865); paintings, drawings, sculpture, and models or designs for works of the fine arts (1870); performance rights in music (1897); motion pictures and photoplays (1912); and performance rights in nondramatic literary works (1952). The original term of copyright was 14 years, with the privilege of renewal for 14 years. In 1831, the first term was increased to 28 years, and in 1909, the renewal term was also increased to 28 years. Before 1891, only citizens or residents of the United States could obtain copyrights. The Act of 1891 extended the privilege to citizens of countries with which the United States had reciprocal copyright agreements. Claims in works by citizens of States adhering to international copyright conventions to which the United States is a party (Mexico City, 1902; Buenos Aires, 1910; and Universal Copyright Convention, 1952) may also be registered, as well as works first published in States adhering to the Universal Copyright Convention.

Detailed information on the various classes of works may be obtained by writing to the Register of Copyrights, Library of Congress, Washington, D.C. 20540.

W 82, total registrations. For 1870–1940, the figures shown in this series exclude commercial prints and labels; see text for series W 92, below.

W 83–85, books, pamphlets, and periodicals. Serial publications issued at regular intervals of less than a year are considered periodicals; otherwise, they are considered books.

W 87, dramatic or dramatico-musical compositions. For 1909 and earlier years, this series pertains only to dramatic compositions.

W 92, commercial prints and labels. Registration of commercial prints and labels in the Patent Office was first authorized by the Act of June 18, 1874. Jurisdiction was transferred to the Register of Copyrights by Public Law 244, 53 Stat. 1142, effective June 30, 1940.

W 94, miscellaneous. Includes lectures, sermons, addresses; reproductions of works of art; drawings or plastic works of a scientific or technical character; and photographs.

W 96–106. General note.

A patent is a grant by the Government to the inventor, his heirs or assigns, of the right to exclude others from making, using, or selling the invention patented. Patents can be obtained for any new and useful machine, manufacture, composition of matter or process, or any new and useful improvement thereof, subject to the requirements and conditions of the law, United States Code, Title 35, Patents. An invention is "useful" if it has lawful purpose and is operative. Since 1946, inventions useful solely in the utilization of fissionable material or atomic energy for atomic weapons have been unpatentable. If the subject matter patented can be used without infringement of the prior rights of others or violation of any applicable statute, the patent, in effect, gives its owner the exclusive right to make, use, or sell the subject of the patent. The subject matter covered by a patent must be sufficiently new as to be not obvious to one skilled in the art to which it relates.

Patents on inventions have been issued by the Federal Government since April 10, 1790. Both the fees charged and the term of patents have been changed occasionally by law. A total fee of $30 was charged on application in 1793; now (1973) a base fee of $65 is charged. Whereas no charge was made prior to 1861 when a patent was granted, modern-day applicants pay an additional minimum fee of $110 at that time. Other smaller fees incidental to the processing of applications may also be charged by the Patent Office.

For 1790–1861, the term of a patent was 14 years. From 1836 until the patents granted in 1861 expired, patents could be extended for an additional 7 years upon application by the patentee and approval of a special board or the Commissioner. About 5 percent of the patents issued during the latter part of this period were extended in this manner. Since 1861, the term of patents on inventions has been fixed at 17 years with extensions possible only by special act of Congress. The number of such extensions has been negligible.

From February 21, 1793, to July 4, 1836, patents were granted on demand of the applicant, upon compliance with the formal requirements, without examination as to novelty and other requirements. Consequently, statistics of patents on inventions issued during this period are more comparable to subsequent statistics of *applications* for patents on inventions (series W 96) than to subsequent statistics of *patents* on inventions. Different sources for patent statistics during this period show minor discrepancies.

Since July 4, 1836, the Patent Office has examined applications for novelty and for compliance with the requirements of the statute and not all applications which are filed become patents. See Department of Commerce, *The Story of the United States Patent Office*, for a brief account of the development of the patent laws; and *General Information Concerning Patents* (revised periodically), for an outline of the patent law.

Other kinds of patents issued are design patents, botanical plant patents, and reissued patents. Reissued patents are patents which are issued to replace another patent to correct some error, and hence have no significance in most uses of patent statistics. They are not shown in this compilation, although reissue applications are included in series W 96 for some years for which they could not be separated. Reissued patents were numbered separately from 1838; the number of the first such patent issued in 1972 is 27,264.

Statistics on various phases of patents on invention are available in various sources. Analyses of aggregate patent statistics appear in Barkev S. Sanders, "The Course of Invention," *Journal of the Patent Office Society*, October 1936; Joseph Rossman and Barkev Sanders, "The Patent Utilization Study," *The Patent, Trademark, and Copyright Journal*, June 1957; Alfred B. Stafford, *Trends of Inven-*

tion in Material Culture, Ph.D. thesis, University of Chicago, 1950; Alfred B. Stafford, "Is the Rate of Invention Declining?" *American Journal of Sociology*, May 1952; Jacob Schmookler, *Invention and Economic Growth*, Harvard University Press, 1966. Statistics of patents issued by industry or by field of technology appear in Simon Kuznets, *Secular Movements in Production and Prices*, Boston, 1930; R. K. Merton, "Fluctuations in the Rate of Industrial Invention," *Quarterly Journal of Economics*, May 1935; *Trends of Invention in Material Culture*, cited above; and *Invention and Economic Growth*, cited above. The basic data used in this work, two volumes bound in one, are on file in the Library of the U.S. Patent Office under the title "Statistics of Patents Classified by Industry, United States, 1837–1957".

Statistics of patents issued by State and country of residence of the inventor appear in the Patent Office, *Annual Report of the Commissioner of Patents*, and in the Bureau of the Census, *Statistical Abstract of the United States*. Since 1966, the annual reports have also included applications filed by country of residence, beginning with calendar year 1961.

International patent statistics are given in P. J. Federico, "Historical Patent Statistics, 1791–1961," *Journal of the Patent Office Society*, vol. 46, Feb. 1964, pages 89–171, which also contains a description of the sources of the statistics for various countries, including the United States. *The English Language International Periodical Industrial Property* (World Intellectual Property Organization, Geneva), published since 1960, has an annual statistical supplement in each December issue, which gives data for a large number of countries including, for many, applications filed by and patents granted to residents of other countries, and additional statistics for the United States.

W 96–98. Patent applications filed on inventions, designs, and botanical plants, 1836–1970.

Source: U.S. Patent Office, 1836–1839, *The Story of the United States Patent Office, 1790–1956*; 1840–1925, *Annual Report of the Commissioner of Patents;* 1926–1970, unpublished data.

Series W 96 involves a slight element of double counting prior to 1940. Before a change in the law on August 5, 1939, made it impossible, an applicant could permit his initial application to lapse and then file a new application covering the same invention. Possibly 2 to 4 percent of the applications filed before 1940 were of this character. For years prior to 1880, series W 96 includes design applications, and for years prior to 1877, also includes reissue applications.

W 99. Total patents issued on inventions, 1790–1970.

Source: 1790–1925, U.S. Patent Office, *Annual Report of the Commissioner of Patents*; 1926–1970, unpublished data.

Patents for inventions are numbered serially, the number of the first patent issued in 1972 being 3,631,539. This numbering system, although instituted later, began with the first patent issued after the Patent Act of July 4, 1836. Most sources of patent statistics give, as the annual number of patents issued, the numbers derived by subtracting the serial numbers of the first patent in each year. However, some serial numbers were not used and are blank; that is, there may not be any patent corresponding to a particular number. This may arise when an application scheduled to be patented, with the patent number assigned, is withdrawn for some reason at a time when it is too late to assign that number to some other case. The blank numbers averaged 26 per year for 1939–1955, but only 7.5 per year for 1961–1970. Beginning with the 1970 edition, the Annual Patent Index includes a listing of the blank numbers, for the period 1920–1970. Through 1971 there were 2,998 blank numbers. In the present series the number of blank numbers has been deducted in each year for which it could be ascertained. Therefore, the statistics of patents on inventions issued since 1836 may run a fraction of a percent below those appearing in some issues of the *Annual Report of the Commissioner of Patents* and in *Historical Statistics of the United States, 1789–1945*. Reissued patents are not shown in this compilation.

Patents granted in a given year cannot be compared with applications filed in the same year since there is a variable lag between the time of applying and the time of issuing a patent. During the last 10 years this lag varied between 2 years and 6 months and 3 years and 3 months as the average time for issuing patents. In addition, variations in the number of patents issued in a given year may be due to administrative problems such as the loss or addition of examining personnel, or rearrangement of printing schedules.

W 100–103. Patents on inventions issued to individuals, to U.S. and foreign corporations, and to the U.S. Government, 1901–1970.

Source: 1901–1935, U.S. Patent Office, unpublished data; 1936–1955, P. J. Federico, *Distribution of Patents Issued to Corporations, 1939–1955*, Washington, D.C., 1957, Study No. 3, table 6 (a report prepared for the Senate Subcommittee on Patents, Trademarks, and Copyrights); 1956–1970, U.S. Patent Office, unpublished data.

Statistics on patents issued to U.S. and foreign corporations are actual counts for 1931–1937, 1955, and 1961–1970; for the other years they are estimates based on samples. Statistics of patents issued to the U.S. Government are based on actual count. This figure does not include patents issued to the Alien Property Custodian during and after World War II. Patents assigned after grant are not included. The patents issued to individuals are obtained by subtraction from the total.

W 104. Patents issued on designs, 1842–1970.

Source: U.S. Patent Office, *Annual Report of the Commissioner of Patents*, and unpublished data.

Designs became patentable in 1842 and relate to the appearance, not to the structure or use, of articles of manufacture. The term for design patents was initially set at 7 years. Since 1861, the term has been 3½, 7, or 14 years, at the discretion of the applicant. Fees payable vary with the term. Design patents are numbered separately. The number of the first design patent issued in 1972 is 222,801.

W 105. Patents issued on botanical plants, 1931–1970.

Source: U.S. Patent Office, unpublished data.

Botanical plants became subject to patents for the first time in 1930. Patentable plants are those which are asexually reproduced—distinct and new varieties of plants other than tuber-propagated plants. The term and fees for plant patents are the same as for patents on inventions. Plant patents are numbered separately from the other patents. The number of the first plant patent issued in 1972 is 3,063.

W 106. Patents issued to residents of foreign countries, 1836–1970.

Source: U.S. Patent Office, *Annual Report of the Commissioner of Patents*, and unpublished data.

The volume of patents issued to citizens of foreign countries was influenced in the early years of the patent system by discriminatory legislation. For 1800–1836, only aliens who had resided in the United States for 2 years and who had declared their intention of becoming citizens could apply for U.S. patents. For 1836–1861, aliens paid higher fees than citizens on a theory of reciprocity. Discrimination based on nationality was eliminated in 1861.

This series is based on residence and not on citizenship. It includes patents on inventions, designs, and botanical plants. Separate statistics on components are not available except for recent years. For the 7 years 1951–1957, foreign residents received 12.6 percent of invention patents, 3.3 percent of design patents, and 12.5 percent of the plant patents. For the period 1964–1970, foreign residents received 22.4 percent of invention patents, 7.0 percent of design patents, and 13.5 percent of the plant patents.

W 107–108. Trademarks registered and renewed, 1870–1970.

Source: U.S. Patent Office, *Annual Report of the Commissioner of Patents*, and unpublished data.

A trademark is a symbol—a picture, word, or phrase—applied by a manufacturer or merchant to distinguish his goods from those of others. Trademark rights are acquired by adoption of a mark and use of it on the goods in trade. The Federal law provides for the registration in the Patent Office of such marks which are used in interstate and foreign commerce. Applications for registration are examined and registration may be refused if the mark is of a character-prohibited registration (national emblems, deceptive marks, purely descriptive marks, etc.) or if it conflicts with a prior registered mark. Federal registration does not create ownership, but only gives additional advantages to the owner. See Department of Commerce, *General Information Concerning Trademarks*, (revised periodically), for an outline of the requirements for registering a trademark.

The first Federal trademark law, that of 1870, was based on the patent and copyright clause of the Constitution instead of the interstate and foreign commerce clause, and was held unconstitutional in 1879. The Trademark Act of 1881 was limited to marks used in foreign commerce. The Act of 1905 included marks used in interstate commerce as well. An Act of 1920 permitted registration of a secondary class of marks not previously registrable. A completely new Act of 1946, effective 1947, provides for a Principal Register on which marks of the type registrable under the Acts of 1881 and 1905 could be registered, and a Supplemental Register on which marks of the type registrable under the Act of 1920 could be registered. Registrations under the Act of 1946 are for a term of 20 years, with renewal possible for successive 20-year terms. Registrations issued under the Acts of 1881 and 1905 remain in force for their unexpired terms and may be renewed in the same manner as registrations under the Act of 1946. Registrations under the Act of 1920 cannot be renewed unless renewal is required to support a Foreign Registration and in such case may be renewed on the Supplemental Register in the same manner as registrations under the Act of 1946.

Chapter W

Research and Development (Series W 109-180)

W 109–180. General note.

Historical statistics on research and development expenditures and employment by various groups in the major sectors of the economy are of comparatively recent origin. Public interest in representing the input of research and development activity in terms of some widely used measure, such as funds expended or personnel employed, has been largely incidental to concern with major national issues. During the depression years of the 1930's this interest stemmed from the role that research played in the recovery of the economy. Groups such as the National Research Project of the Work Projects Administration (formerly the Works Progress Administration) and the National Resources Planning Board engaged in studies of the interrelationships among trends in research and development, technological change, unemployment, education, and other major economic and social factors. Their interest in measuring research and development was generally subsidiary to a larger preoccupation with such broad national issues as economic recovery, re-employment, and national planning. The research and development estimates which they published were intended to serve primarily as illustrative background materials.

The period of World War II and its aftermath dramatized the critical place of research and development in the Nation's military security program. Groups concerned with measuring research and development during this period included the Committee on Science and Public Welfare (Bowman Committee), the President's Scientific Research Board, and the Research and Development Board of the Department of Defense. Like the earlier groups, these organizations supplemented fragmentary data already on hand with special inquiries and analyses in order to develop background estimates on research and development trends.

The National Science Foundation, a Federal agency established in 1950, undertook as one of its functions the development of such factual data and related analyses on research and development. As a first step, the Foundation initiated an annual survey of Federal funds for research and development, starting with data on funds for scientific research and development at nonprofit institutions for fiscal 1951 and 1952 and moving thereafter to annual surveys of the funds comprising the "Federal Research and Development Budget."

In 1954, the National Science Foundation undertook the first effort to measure the volume of research and development activity, in terms of funds and personnel, through surveys of all major types of organizations in the several sectors of the economy which were known to be performing or financing this activity. Out of this effort grew a continuing Foundation program of surveys designed to facilitate preparation of annual estimates on funds and personnel employed in research and development by the major sectors of the economy. Before the National Science Foundation undertook its first surveys, there was no general agreement on such fundamental matters as the definition of research and development; the distinction between the conduct of research and development and such related activities as academic instruction or industrial production; the distinction between basic and applied research and development; and the major characteristics distinguishing various types of research organizations.

National estimates. National estimates of funds spent on the performance of research and development by the four major sectors of the economy have been made by the National Science Foundation for 1953–70. National estimates of funds received from various sources for the performance of research and development have also been made for 1953–70. These series appear in table B-1 of the National Science Foundation publication, *National Patterns of R&D Resources, 1953–72*, Funds and Manpower in the United States, (NSF 72–300). An analysis of intersectoral flows of transfers of funds for research and development for 1970 appears in table I, below. This table is based on information obtained in the National Science Foundation surveys of funds for research and development in 1970 as presented in table B-1.

The limitations described below indicate that table I should be considered a general approximation rather than an exact statement of the extent to which the different sectors are participating in the financing and performance of research and development.

Detailed information on the scope and limitations of the various surveys appears in the National Science Foundation publications listed below. Generally speaking, the National Science Foundation surveys seek full enumeration of the various segments. The exceptions are industrial firms and the smaller nonprofit institutions for which sampling procedures are employed.

The data in table I are derived basically from survey responses by *performers* of research and development as to how much they spent

Table I. Intersectoral Transfers of Funds Used for Performance of Research and Development: 1970

[In millions of dollars, except as indicated. Based on reports by performers]

Sources of funds, by sector	Research and development performers					Total	
	Federal Government agencies	Industry [1]	Universities and colleges [2]		Other nonprofit institutions [1]	Amount	Percent
			Total	Associated FFRDC's [3]			
Federal Government agencies	3,855	7,779	1,648	737	745	14,764	56.7
Industry		[4] 10,283	61		90	10,434	40.1
Universities and colleges			[4] 461			461	1.8
Other nonprofit institutions			165		[4] 223	388	1.5
Total	3,855	18,062	2,335	737	1,058	26,047	100.0
Percent	14.8	69.3	9.0	2.8	4.1		100.0

[1] Expenditures for Federally Funded Research and Development Centers (FFRDC's) administered by both industry and by nonprofit institutions are included in the totals of their respective sectors. FFRDC's are organizations exclusively or substantially financed by the Federal Government to meet a particular requirement or to provide major facilities for research and training purposes.

[2] Includes agricultural experiment stations.

[3] Federally Funded Research and Development Centers (FFRDC's) administered by individual universities and colleges and by university-consortia.

[4] Includes State and local government funds.

on this activity and where their funds originated. The estimates represent final through-transfers from source organizations financing research and development to performing organizations which ultimately used the funds. Every effort was made to net out intermediate transfers.

Research and development in these series consist of basic and applied research in the sciences (including medical sciences) and in engineering and activities in development, all defined below. In terms of fields, the natural sciences—life, physical, and engineering—as well as the social and psychological sciences are covered in the Federal, universities, and other nonprofit sectors. Industry coverage is limited, at present, to the natural sciences. Research and development excludes routine product testing, quality control, mapping surveys, collection of general-purpose statistics, experimental production, and activities concerned primarily with the dissemination of scientific information and the training of scientific manpower.

Research, which is made up of basic and applied, is systematic, intensive study directed toward fuller scientific knowledge of the subject studied.

Basic research. For three of the sectors—Federal Government, universities and colleges, and other nonprofit institutions—the definition of basic research stresses that it is directed toward increases of knowledge in science with ". . . the primary aim of the investigator being a fuller knowledge or understanding of the subject under study, rather than a practical application thereof." To take account of an individual industrial company's commercial goals, the definition for the industry sector is modified to indicate that basic research projects represent "original investigations for the advancement of scientific knowledge . . . which do not have specific commercial objectives, although they may be in fields of present or potential interest to the reporting company."

Applied research. The core definition in the NSF questionnaire sent to the universities and colleges is: "*Applied research* is directed toward practical application of knowledge." Here again, the definition for the industry survey takes account of the characteristics of industrial organizations—it covers ". . . research projects which represent investigations directed to discovery of new scientific knowledge and which have specific commercial objectives with respect to either projects or processes." By this definition, applied research in industry differs from basic research chiefly in terms of objectives of the reporting company.

Development. The NSF survey concept of development may be summarized as ". . . the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems or methods, including design and development of prototypes and processes."

Funds used for research and development refer to current operating costs, consisting of both direct and indirect costs including depreciation, insofar as this information is available to respondents. Capital expenditures are excluded by definition in both the industry and the other nonprofit sectors. Under the accounting practices of some Federal agencies, particularly the Department of Defense, data on the Federal R&D funds, which are available in detail only in terms of obligations rather than expenditures, do not include an allowance for depreciation but do include some obligations for capital items. A small amount of capital outlays is also included in the universities and colleges sector.

The National Science Foundation surveys include data on research and development by Federally Funded Research and Development Centers (FFRDC's). These are laboratories or similar research undertakings supported wholly or predominantly by the Federal Government but operated under contract by an industrial, university, or independent organization. Data relating to the performance of research and development at these centers are included within the appropriate sector in the estimates for 1956 and later years.

Several groups of organizations comprise the industry sector as represented in table I. Private industrial firms account for over 95 percent of the total funds for performance of research and development in this sector. (Data for firms appear in series W 144–160.) The remaining groups are FFRDC's operated by industrial concerns, independent commercial laboratories, and engineering service firms.

The colleges and universities sector consists of institutions of higher education with substantial research programs and of the FFRDC's operated under contract by educational institutions. Included in institutions of higher education are their affiliated research organizations, agricultural research centers, graduate and professional schools, and affiliated hospitals.

Other nonprofit institutions include privately endowed philanthropic foundations, nonprofit research institutes, voluntary health agencies, academies of science, professional societies, museums, zoological gardens, and arboretums, as well as several FFRDC's operated by independent organizations.

The data on transfers of funds were based on estimates from many institutions having somewhat different understandings of costs and expenditures. The estimates for Federal agencies, moreover, were based on obligations rather than expenditures, since information on transfers to the other sectors was available only for obligations. (Additional details appear in series W 126–143.)

For detailed information and trend data on R&D funds and scientific personnel, see the following publications: *National Patterns of R&D Resources, Funds and Manpower in the United States* (annual); *Federal Funds for Research, Development, and Other Scientific Activities* (annual); *Research and Development in Industry* (annual); *Scientific Activities at Universities and Colleges* (biennial); *Scientific Activities of Nonprofit Institutions* (periodic); *American Science Manpower* (biennial); *Scientific, Technical, and Health Personnel in the Federal Government* (annual); and *Employment of Scientists and Engineers in the United States, 1950–66.*

Early major efforts to estimate the volume of research and development. The methodology, scope, and limitations of the various series are often summarized in the publications cited below, and any use of these estimates in descriptive or analytical work should be preceded by a careful review of their limitations. Differences in concepts and scope of these earlier series make comparisons with the later NSF data not generally possible.

George Perazich and Philip M. Field, *Industrial Research and Changing Technology*, Work Projects Administration, National Research Project, Philadelphia, 1940, pp. 5–17 and 52–79. This report presents data on research personnel in industrial laboratories for 1920, 1921, 1927, 1931, 1933, and 1938. The data are based on the six directory listings on industrial research laboratories in the United States published by the National Research Council between 1920 and 1938.

National Resources Committee (later, National Resources Planning Board), *Research, A National Resource*, vol. 1, *Relation of the Federal Government to Research*, Report of the National Resources Planning Board Science Committee, 1938. Section 3, pp. 61–112, of this report presents estimates of Federal expenditures for research in 1937 and 1938. Table D, p. 91, summarizes from other sources a number of earlier estimates of Federal expenditures going back as far as 1901. Section 6, pp. 167–193, contains a discussion of research in American universities and colleges. It also provides a general estimate of the dollar volume of expenditures for research and development for 1935–1936.

National Resources Planning Board, *Research, A National Resource*, vol. II, *Industrial Research*, a report of the National Research Council to the National Resources Planning Board, 1941. Section IV, pp. 173–187 of this report, presents estimates of research personnel in industrial laboratories for 1940; and section II, part 7, pp. 120–123, shows research personnel and expenditures in 31 firms for 1937.

U.S. Senate, Committee on Military Affairs, Subcommittee on War Mobilization (Harley M. Kilgore, Chairman), *Report on the Government's Wartime Research and Development, 1940–44*, 1945. Part I of this report presents detail, and part II summarizes data on funds for research and development for each of 45 Federal agencies

and bureaus, with detail on the fiscal sources of funds and the major categories of recipients for fiscal years 1940 through 1944.

Vannevar Bush, *Science, The Endless Frontier, A Report to the President*, July 1945, appendix 3, "Report of the Committee on Science and Public Welfare" (Isaiah Bowman, Chairman). The Bowman Committee's report to Dr. Bush presents the first known national estimates of trends in scientific research and development expenditures in table I, p. 80. It also contains series on scientific research expenditures (based largely on performance of research) for the following major groups: (*a*) Industry—annual expenditures estimates for 1920–1940; (*b*) nonprofit industrial research institutes—annual expenditures estimates for 1930–1942; (*c*) Government (Federal and State)—annual estimates for 1923–1932, 1934–1938, and 1940–1944; (*d*) colleges and universities—biennial estimates, 1930, 1932, 1934, 1936, 1938, 1940, and 1942; (*e*) research institutes (not connected with any industry nor an integral part of any university)—annual estimates for 1930–1940; and (*f*) total scientific research expenditures—total of the foregoing five series for 1930, 1932, 1934, 1936, 1938, and 1940.

The President's Scientific Research Board (John R. Steelman, Chairman), *Science and Public Policy, A Report to the President*, vols. I, II, and IV, 1947. Based on data in Vannevar Bush, *Science, The Endless Frontier* (cited above, vol. I, *A Program for the Nation*, presents for the even years of 1930–1940 estimated expenditures by the Federal Government, industry, universities, and others. Estimates are also made of the average annual expenditures by major groups for 1941–1945 and of expenditures for 1947. Vol. II, *The Federal Research Program*, presents estimates of Federal "expenditures for research and development in the physical and biological sciences" in fiscal year 1947 based on project reports from the individual agencies. Vol. IV, *Manpower for Research*, presents annual estimates and forecasts of scientists and engineers in industrial research laboratories for 1929–1956.

Helen Wood, Robert Cain, and Joseph H. Schuster, *Scientific Research and Development in American Industry, A Study of Manpower and Costs*, Bulletin No. 1148, U.S. Bureau of Labor Statistics, prepared in cooperation with the Department of Defense, 1953. Data in this publication are based on the first survey specifically designed to obtain research and development performance costs and personnel for private firms. The report presents estimates of expenditures for research and development performed in 1951 by firms reporting. Personnel data cover research and development scientists and engineers employed by these firms in January 1951 and 1952.

Office of the Secretary of Defense, *The Growth of Scientific Research and Development*, 1953. This publication presents annual estimates on sources of research and development funds and on performance of research and development for 1941–1952 for the Federal Government, industry, and nonprofit institutions including colleges and universities. Estimates of the number of scientists and engineers employed in research and development by these broad sectors are also shown for the same years. No methodological notes accompany the estimates. They are known to be based on materials in Wood, Cain, and Schuster (cited above); U.S. Senate Committee on Military Affairs, Subcommittee on War Mobilization (cited above); and other published and unpublished sources.

Office of Education, *Statistics of Higher Education; Receipts, Expenditures, and Property, 1953–54*, 1957. This report presents biennial estimates on expenditures for performance of "Organized research" by institutions of higher education, 1930–1954. See series H 732 in this volume. This is the oldest known current series on research expenditures.

More recently, beginning with Bureau of the Budget, *The Budget of the United States Government, 1955*, the Federal budget documents have carried a special analysis of "Federal Research and Development Programs" summarizing expenditures and/or obligations for research and development and R&D plant on an agency basis. In *The Budget, 1972*, this was Special Analysis R and covered fiscal years 1970, 1971, and 1972.

W 109–125. Funds expended for performance of research and development and basic research, by sector, and major function, 1953–1970.

Source: U.S. National Science Foundation, *National Patterns of R&D Resources, 1953–72*, Funds and Manpower in the United States (NSF 72–300).

The four-sector division followed by the National Science Foundation attempts to take account of both the legal nature and major functions of organizations active in financing and performing basic research, applied research, and development. However, grouping diverse types of organizations into discrete sectors requires certain arbitrary judgments because of the mixed nature of many organizations, particularly those in the university and other nonprofit sectors.

The *Federal sector* is made up of the agencies of the Federal Government.

The *industry sector* consists of both manufacturing and nonmanufacturing companies. Manufacturing is surveyed in major industry groupings; and nonmanufacturing, which includes organizations such as those in selected service industries, is treated as a unit. Federally Funded Research and Development Centers (FFRDC's) administered by industrial firms are also included.

The *universities and colleges sector* is composed of all institutions of higher education, both public and private. The term "universities and colleges" is used to refer to the academic institutions as a group without the associated FFRDC's administered by the schools for various Federal agencies. The universities and colleges comprise the following:

> Colleges of liberal arts; schools of arts and sciences; professional schools, such as engineering and medical schools, including affiliated hospitals; associated research institutions, and similar organizations, which are integral parts of the universities and colleges; agricultural experiment stations and associated schools of agriculture.

Funds used at the universities and attributed to the universities sector as a source consist of: (a) State and local government funds separately budgeted for research and development, (b) the direct or indirect costs of R&D performance sponsored by outside organizations that were defrayed in part by universities and colleges in accordance with cost sharing or other arrangements, and (c) unrestricted or general funds which the institutions themselves have been free to allocate for research either through their instructional or departmental budget or through their own separately budgeted research. Funds from the Federal Government, industry, or other nonprofit institutions, which are supplied in the form of grants or contracts for research or development at a university, are credited to the appropriate source in the performance of research and development by universities and colleges. Thus, research contracts from industry are treated as university performance funded by industry as the source, whereas funds given to the institution by industry for general educational purposes and used by the school, at its discretion, for research, are treated as university performance financed with the university's own funds.

Institutions in the *other nonprofit sector* fall into two general groups: (1) Organizations that are primarily granting in nature, namely private philanthropic foundations and voluntary health agencies, and (2) public and private organizations that are primarily involved in performing research and development, comprising separately incorporated nonprofit research institutes, professional societies, academies of science, museums, zoological gardens, botanical gardens, arboretums, nonprofit hospitals, and FFRDC's administered by nonprofit organizations.

In these series, both the university and the other nonprofit sectors contain private and public institutions—the latter either closely associated with or considered a part of State or local government. A number of organizations in both sectors, as well as in industry, also receive State and local government funds.

In the Foundation's surveys, respondents in all four sectors indicate the amounts they spend on research and development in their own sector and the sources of these funds. The National Science Foundation bases all national totals on data as reported by performers because institutions doing research and development are in the best position to: (a) indicate how much they spent in the actual conduct of research and development in a given year, (b) classify their work as basic, applied, etc. and (c) identify the sector of the economy in which their financing originated. The use of performer reporting throughout also reduces the possibility of double counting. Because the national time series on Federal funds spent in research and development are based on expenditures reported by organizations which have actually performed the research and development, they differ from the series in *Federal Funds for Research, Development, and Other Scientific Activities* on agency obligations for research and development to be performed in the non-Federal sectors. Federal agency obligations are used in the series only for intramural performance in agency laboratories where they are treated as the equivalent of expenditures. Expenses of Federal personnel engaged in planning and administering intramural and extramural R&D programs are also included in the intramural performance total.

W 126–143. Federal funds for research and development, by agency, 1947–1970.

Source: 1947–1951, U.S. Bureau of the Budget (now the Office of Management and Budget), unpublished data; 1952–1970, U.S. National Science Foundation, *Federal Funds for Research, Development, and Other Scientific Activities*, Vol. XXI.

Obligations represent orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds were appropriated and when future payment of money is required. One of the limitations of these data is that they are two series compiled at different times and on somewhat different bases. The first series, FY 1947–51, was compiled by the Bureau of the Budget. The second series, FY 1952–70, is based on agency submissions to the National Science Foundation for its annual survey on *Federal Funds for Research, Development, and Other Scientific Activities*. Since Government accounting does not use research and development as a uniform bookkeeping category for all agencies, the data represent estimates by informed persons.

Expenditures represent checks issued and cash payments made during a given period, regardless of when the funds were appropriated.

For agencies operating on a cost-type budget, accrued expenditures and costs are reported instead of obligations. Accrued expenditures represent all costs accrued during the reporting period except those subject to reimbursement from other agencies.

The obligations and expenditures reported cover all transactions from all funds available from direct appropriations, trust funds or special account receipts, corporate income, or other sources, including funds appropriated to the President that an agency received or expects to receive. The amounts reported for each year reflect obligations and expenditures for that year regardless of when the funds were originally authorized or received and regardless of whether they were appropriated, received, or identified specifically for research, development, or R&D plant.

Funds reported for research and development reflect full costs. In addition to costs of specific R&D projects, the applicable overhead costs are also included. The amounts reported include the costs of planning and administering R&D programs, laboratory overhead, pay of military personnel, and departmental administration.

R&D plant (or R&D facilities and fixed equipment, such as reactors, wind tunnels, and radio telescopes) includes acquisition of, construction of, major repairs to, or alterations in structures, works, equipment, facilities, or land, for use in R&D activities at Federal or non-Federal installations. Excluded from the R&D plant category are expendable equipment and office furniture and equipment. Obligations for foreign R&D plant are limited to Federal funds for facilities located abroad and used in support of foreign research and development.

W 144–160. Funds for industrial research and development, by industry, 1956–1970.

Source: U.S. National Science Foundation, *Research and Development in Industry*, annual reports.

The report covering R&D expenditures for 1956 and 1957 follows the general format used in subsequent annual reports. The National Science Foundation also sponsored two industry surveys covering the 1953–56 period, which were conducted by the U.S. Bureau of Labor Statistics (BLS): *Science and Engineering in American Industry, Final Report on a 1953–54 Survey* (NSF 56–16) and *Science and Engineering in American Industry, 1956* (NSF 59–50). Data obtained in the BLS surveys are not directly comparable with U.S. Bureau of the Census figures for 1957–70 because of methodological and other differences in the surveys conducted by the two agencies and have, therefore, been excluded. In addition, the Census surveys, beginning in 1957, have collected data on the R&D activities of Federally Funded Research and Development Centers (FFRDC's) operated by business firms, whereas the earlier BLS surveys did not. To account for the R&D performance of these research centers in 1956, Census adjusted data for that year (collected in the 1957 survey) to provide comparable trend data from 1956 forward.

The surveys in this series have made use of the "shuttle" type questionnaire, permitting respondents to report information for the current year and at the same time make revisions as necessary in figures for the preceding year, which were preentered by the Bureau of the Census.

Research and development as defined in these series, includes basic and applied research in the physical and life sciences (including medicine) and in engineering, and design and development of prototypes and processes. This definition excludes quality control, routine product testing, market exploration, research in the social sciences or psychology, or other nontechnological activities or technical services.

Expenditures, as defined in these series, include salaries of research and development scientists and engineers and their supporting personnel, other direct costs, service and supporting costs, plus attributable overhead expenses incurred in such items as administration, depreciation, and rent. Expenditures also include Federal funds for private industry performance of research and development ranging from about 40 percent of total expenditures in 1953 to about 50 percent in 1970. The totals exclude capital expenditures and patent expenses.

The industry surveys conducted by the Bureau of the Census for the National Science Foundation use the company as the reporting unit. The company is defined as a corporate entity that includes all establishments under common ownership or control. Each company is classified in a single industry on the basis of its primary business activity, although many companies engage in research and development and productive activities outside the industry in which they are classified. Since many firms are active in several diverse product fields, data collected in this survey are not comparable with figures reported elsewhere on an establishment basis.

For the period 1963–70, companies in the survey have been assigned an industry classification based on the 1963 economic censuses conducted by the Bureau of the Census. Similarly, figures for 1958 and earlier years are based on the company classifications resulting from the 1958 economic censuses. To provide a continuous time series, individual industry data for 1959–1962 (previously classified on the 1958 basis) have been adjusted to account for the differences in absolute level resulting from the two classifications. A detailed explanation of the adjustment technique is contained in the Technical Notes section of the industry reports.

W 161–167. Funds for industrial research and development, by character of work, and cost per scientist or engineer, 1953–1970.

Source: U.S. National Science Foundation, **series W 161–165** and **W 167**, *Research and Development in Industry, 1970* (NSF 72–309) pp. 68 and 83; **series W 166**, unpublished data.

For series W 161–165, see the general note for series W 109–180.

W 166, R&D scientists and engineers. Those engaged full time in research and development and the full-time equivalent (FTE) of those working part time. Scientists and engineers are defined as persons engaged in scientific or engineering work at a level which requires a knowledge of physical, life, engineering, or mathematical sciences equivalent at least to that acquired through completion of a 4-year college course with a major in one of those fields.

W 167, cost per R&D scientist or engineer. The number of R&D scientists and engineers used to estimate the cost per R&D scientist or engineer for 1967–70 is the number of man-years; between 1957 and 1966, the arithmetic means of the numbers of R&D scientists and engineers reported in each industry for January in two consecutive years was used.

W 168–180. Employment of natural scientists and engineers, 1950–1970.

Source: U.S. Bureau of Labor Statistics, unpublished data.

Scientists and engineers in these data include those who "work as" *natural* scientists or engineers. This concept, therefore, includes persons without college degrees in science and engineering who were working in engineering and science jobs. It does not include individuals with college degrees in science and engineering who are not working in these fields. Also excluded are social scientists and high school teachers of science subjects, as well as medical scientists who spend the greatest portion of their time providing care to patients.

The basic definitions used in these series are those used in the periodic surveys of scientific and technical personnel in private industry and in State and local governments, conducted by the Bureau of Labor Statistics (BLS). These surveys cover about four-fifths of all scientists and engineers. Following are definitions used in these surveys: (1) Scientists and engineers are workers who perform at a level requiring education or training equivalent to that acquired through completion of a 4-year college course with a major in a natural scientific or engineering field; (2) R&D scientists and engineers are defined as those who spend the greater portion of their time in basic and applied research in the natural sciences (including medical science) and engineering, and in design and development of prototypes and processes; (3) Employment data include all workers employed as scientists and engineers whether full or part time.

Annual estimates refer to January or "early-in-year" employment. Adjustments were necessary to survey data on Federal Government and local governments, as October was generally the date of the surveys in these sectors.

Historically, surveys of science and engineering employment have been made separately for six major sectors of the economy—private industry, Federal Government, State governments, local governments, universities and colleges, and nonprofit organizations. In private industry, surveys of scientific and technical personnel were conducted by BLS for the years 1952, 1954, annually 1959 through 1964, 1966, 1968, and 1969. Data on State government employment, also collected by BLS, are available only for the years 1959, 1962, and 1964. Other nonrecurring BLS surveys in this field include a survey of science and engineering employment in local governments for the year 1963 and a pilot survey covering such employment in six States in 1960. Surveys of science and engineering employment in universities and colleges were conducted by the National Science Foundation in 1954, 1958, 1961, 1965, 1967, and 1969. Scientists and engineers employed by nonprofit organizations were surveyed by BLS in 1958 and the NSF in 1965 and 1967. An NSF survey in 1960 of such employment was limited in scope.

Other sources of information used included BLS establishment data on total wage and salary worker employment and production worker employment; information from the Decennial Census of Population, 1950 and 1960; Bureau of the Census, Current Population Surveys; information on R&D expenditures from the NSF and Department of Defense; information from the NSF's National Register of Scientific and Technical Personnel on scientists, by field, type of employer, and function; and data on full time equivalent R&D employment of scientists and engineers in private industry from NSF reports.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

[1] Includes State and local government funds received by these institutions and used for research and development.

[2] Federally Funded Research and Development Centers administered by individual universities and colleges and by university consortia.

[3] Includes estimates for independent nonprofit hospitals and voluntary health agencies.

[4] Defense expenditures consist of all R&D spending by the Department of Defense (DOD) and a portion of Atomic Energy Commssion funds. Space R&D expenditures are those of the National Aeronautics and Space Administration. The space activities of DOD are included as spending on defense. The space activities of other Federal agencies are not included; they are estimated to account for less than 5 percent of all space R&D spending.

[5] Basic research, applied research, and development.

[6] Calendar year data for industry and nonprofit institutions combined with Federal and university data for fiscal year 1953 (July 1952–June 1953).

Series W 126–143. Federal Funds for Research and Development, by Agency: 1947 to 1970

Chapter X

Financial Markets and Institutions

Flow of Funds (Series X 1-392)

X 1–392. General note.

These data present an integrated picture of financial claims outstanding in the U.S. economy. They summarize the types of claims, who owes them as liabilities, who holds them as assets, and, for some major groups in the economy, how lending and borrowing are related to income and expenditure flows. The data are based on a wide range of information from public and private statistical sources. Directly or indirectly they reflect banking statistics, Treasury accounts, Census data, tax return compilations, balance of payments statements, security market data, and balance sheet tabulations for several kinds of nonbank financial institutions. Data from these diverse sources have been adjusted in many ways to make them consistent with one another in coverage and in definition of types of claim. The process of adjusting them into consistency produces a total system of financial accounts for the economy that includes separate statements of financial position and of transactions for each major institutional group in the system. As a whole, this financial accounting structure constitutes the flow-of-funds system of accounts published by the Federal Reserve System.

Broadly grouped, this section has three parts: (1) a summary of total debt and the structure of assets that finances that debt; (2) statements for households, business, and State and local governments on their saving and investment and financial positions; and (3) summaries for major financial markets of lending and borrowing positions.

Some of the tables include data on both amounts of claims outstanding at year-ends and net flows during years. For most financial claims, the net flows are the changes over years in outstandings and represent the excess of new claims created or acquired during the year over repayments or other disposition. There are exceptions, however, notably in equities in corporate and noncorporate business. Capital supplied to business through corporate stock issues or through proprietors' equity investment appears in the flows as external sources of funds to business and as uses of funds by investors; as equity positions such funds are not included in business liabilities in the tables on outstandings. Corporate equity assets are shown at market value based on prices on stock exchanges, while noncorporate equities are omitted for lack of information on values. Changes in market prices cause the aggregate market value of corporate equities to fluctuate far more from year to year than would be accounted for by net purchases, and the difference is capital gains and losses, mainly unrealized, that are not included in the tables on net flows. For equity markets, therefore, the tables on outstandings and on flows reflect separate aspects of developments.

Tables on flows for households, business, and governments are broader than the tables on outstandings in that they are full statements of saving and investment for the groups covered, including income, spending, and physical asset purchases as well as lending and borrowing. The data on saving and tangible investment for these groups are taken directly from national income accounts, which are summarized in chapter F. The relation between the amounts shown here and national income data are described in the November 1965 *Federal Reserve Bulletin*, pages 1534–1538. For each of these groups, saving and investment are defined to be equal although measured differently, with saving the excess of current receipts over current outlays and investment the sum of outlays for tangibles and financial assets less net borrowing. Because saving and investment are calculated from separate bodies of data, there are inevitable discrepancies between the two that are also shown in the tables.

The tables of net flows for these three groups relate in outstandings to complete balance sheets that include physical assets and net worth as well as the financial assets and liabilities that are included in the tables on outstandings. Changes in net worth in such balance sheets would equal saving (as shown in the flow tables), plus capital gains, while changes in assets less liabilities would equal net investment flows plus the same capital gains.

Complete balance sheets consistent with saving and investment flows are being developed on an economy-wide basis but (as of July 1975) are not in a form that can be included here. These balance sheets require estimates of tangible asset holdings on a uniform valuation basis, with totals for all groups in the economy that are consistent with tangible asset totals of the kind shown in chapter F. Until these estimates are completed only partial balance sheets can be shown, covering financial assets, liabilities, and a net difference that is the financial net worth of each group. When tangible asset holdings can be added to these financial net worth figures, it will be possible to cumulate wealth estimates for individual groups into national wealth totals that are consistent with those shown in chapter F. Most of the financial claims included are both held and owed within the national economy and are canceled out in national wealth cumulations, but they are major elements in the distribution of wealth ownership. At the same time their net sum—the excess of U.S. claims on foreigners over foreign claims on the U.S.—represents the financial component of total national wealth.

The primary interest in these tables on financial claims, however, lies not in their relation to national wealth estimates but rather in the picture of financial structure that they give, the indications of debt burden, liquidity positions, structure of intermediation, and surplus-deficit positions that can be derived from them. While most of the debt is not part of national wealth, the structure of debt—long term or short term—and who owes it—government, business, or households—have important bearings on private spending decisions. The forms of private financial assets—deposits, long-term securities, and so forth—have influences on credit availability as well as on spending. The tables on outstandings are intended to indicate these aspects of financial structure, while the tables on flows give the relation of financial market transactions to nonfinancial activity that generates both the saving from which credit is supplied and the spending for which credit is demanded.

As a group the tables are selective in several ways, since there is not space to include a total statement of all financial activity. Thus, the three summary tables (series X 1–113) encompass all sectors of the economy but are limited primarily to their credit market activities. The tables on individual sectors (series X 114–262) cover all transactions and financial positions of the groups that have been included but represent only the private nonfinancial economy. The principal omissions are banks and other financial institutions, the Federal Government, and foreign transactors. These are covered in somewhat different form in other sections of this volume. The tables on individual financial markets (series X 263–392) are also selective in that they cover all flows into and out of major markets covered but do not include all financial markets. In this area the most important omission is bank loans, which again is covered elsewhere.

Other omissions consist of security credit, commercial paper, and a variety of other credit forms that are relatively small.

X 1-113. General note.

These series are a summary of total credit in the economy and its sources. The forms of credit included are indicated in series X 1-23. Other kinds of financial obligation that are not directly part of credit markets are omitted. Most of these other obligations are represented in series X 114-262.

X 1-23. Debt of nonfinancial borrowers, 1945-1970.

Source: Board of Governors of the Federal Reserve System, *Flow of Funds Accounts: Financial Assets and Liabilities Outstanding, 1945-1971*, and unpublished data.

This set of financial claims, owed by governments, households, nonfinancial business, and foreigners, is an approximation to a base amount of total credit that is used to finance nonfinancial activity in the economy, such as public deficits, business capital formation and inventories, home building, and consumer durables purchases. Government debt omits most public intermediation in financial markets, such as in federally sponsored credit agencies, and the private borrowing omits security credit, book trade accounts, direct foreign investment, other more informal types of financial relationship, and all liabilities of financial intermediaries. For private borrowers the flow of credit included is related closely in total to the volume of capital expenditures, with variations in the relationship and in forms of debt that reflect changing credit conditions.

U.S. Government debt shown is essentially the total for net public borrowing in unified budget presentations. It excludes intragovernment holdings that are part of the larger total of public debt subject to statutory limitation. The unified budget has been published by the Treasury only from the beginning of 1969, but the figures for earlier years have been adjusted to that basis for consistency over time. The figures include Treasury securities, issues by other budget agencies, loan participation certificates, mortgage debt, and Commodity Credit Corporation (CCC) certificates of interest.

State and local government debt is derived from the census of governments.

Corporate and foreign securities are based on Securities and Exchange Commission data on net change in outstandings; the totals for outstandings are Federal Reserve estimates. The figures exclude all issues by financial institutions, and exclude liability for corporate equities outstanding.

Mortgage totals are as published by the Federal Reserve except that they exclude loans in process of disbursement and Federal Government debt in mortgage form.

Bank loans are from banking statistics and are essentially total business loans, farm loans, and loans to individuals after removing credit in the form of open-market paper, CCC-guaranteed loans, consumer credit, and security credit. Loans to financial business are omitted. Consumer credit is as published by the Federal Reserve. Open-market paper consists of dealer-placed commercial paper issued by nonfinancial corporations and bankers' acceptances. Other loans consist mainly of business credit from finance companies and loans by the U.S. Government and federally sponsored credit agencies to business, households, and foreigners. They include foreign loans in aid programs and Export-Import Bank credit.

X 24-63. Funds raised in credit markets by nonfinancial sectors, 1946-1970.

Source: Board of Governors of the Federal Reserve System, *Flow of Funds Accounts: Annual Flows, 1946-1971*, and unpublished data.

See text for series X 1-23.

X 64-113. Sources of credit market funds, 1945-1970.

Source: See source for series X 1-23.

These series distribute, as assets in the economy, the credit totals that appear in series X 1-23 as liabilities, indicating at the same time the position of financial intermediaries and governmental credit agencies in the structure of supply. The series are divided into three sections—credit from public agencies and foreign investors, assets and liabilities of private intermediaries, and assets of private domestic nonfinancial groups. Public agency credit includes—in addition to direct lending by Federal Government agencies—Federal Reserve credit related to money supply and bank reserves, loans by federally sponsored credit agencies, and foreign holdings of credit market instruments. The sponsored credit agencies (series X 71) are a group of institutions that at some time before 1970 had been part of or partly owned by the Federal Government or other sponsored agencies: Federal National Mortgage Association, Federal Home Loan Mortgage Corporation, Federal home loan banks, Federal intermediate credit banks, banks for cooperatives, and Federal land banks. The sponsored agency figures also include mortgage pools backing securities guaranteed by the Government National Mortgage Association. Lending by the sponsored agencies is financed mainly by issues of their own securities to private investors, and in series X 74 these agency issues are brought into total credit holdings of private domestic lenders, shown in series X 75, and private holdings of Government securities, in series X 76. Some of these agency issues finance loans to financial intermediaries (series X 68) that are not part of the debt of nonfinancial sectors (series X 64) and such loans (series X 81) are excluded from net private holdings (series X 75). Foreign holdings (series X 73) are mainly official, such as at central banks, in recent years.

Private domestic holdings of credit instruments are partly in the portfolios of intermediaries (series X 82), and the volume of intermediation is a strong influence on the forms of credit supply. Intermediaries held far more, proportionately, in direct loans to business and housing than nonfinancial investors, whose portfolios of direct credit instruments consist mainly of securities issued in public markets. Hence a period of large credit flows through intermediaries is typically also a period when loan volume is large compared with net new security issues. Intermediary credit supply is heavily dependent on domestic deposit flows to banks and savings institutions, although these institutions also borrow directly in credit markets or from foreign sources to some extent. The relative importance of sources of intermediary funds is indicated in series X 87-93.

Direct lending in credit markets from nonfinancial groups in the private economy (series X 94) exhausts the total of credit outstanding, where, at this level, the total includes borrowing by public credit agencies (series X 74) and private intermediaries (series X 88) as well as nonfinancial sectors (series X 64). For these nonfinancial investors, credit instruments are part of a portfolio that includes deposits at intermediaries that appear earlier as sources of intermediary lending (series X 87). As private assets the deposits are shown beyond credit instrument holdings, together with currency claims on the Federal Reserve. A total portfolio of securities and deposits (series X 105) for private domestic nonfinancial investors appears at the end of this set of assets.

Corporate equity markets (series X 109-113) are excluded entirely from the preceding series on credit market instruments. Holding of equities are stated at year-end market values, and movements in holdings reflect to a large extent capital gains and losses, whether realized or unrealized, that result from market price movements.

X 114-262. General note.

These series present full financial statements for three major groups in the economy—households, business, and State and local governments. They include a variety of obligations that are not directly in the credit markets summarized in the preceding series, such as insurance claims and taxes payable.

X 114-191. General note.

These series consolidate trusts and nonprofit organizations with households mainly because data for a separation of the three groups have been lacking until recent years. From available information, trusts and nonprofit groups appear to hold less than 10 percent of the assets shown in series X 114-147, and their debts are mainly in nonresidential mortgages (series X 140). Apart from these institutional investors, the financial positions shown by series X 114-147 are aggregates for individuals as personal investors and borrowers.

These series omit assets and liabilities connected with noncorporate business, such as trade receivables, commercial and farm mortgages, and business loans from banks; noncorporate business finances are included in series X 192-228. In this respect, the household series shown here differ in coverage from those on individual savings (series F 566-594), which include noncorporate business.

The data for household saving and investment (series X 148-191) include as one item a net flow of equity funds from noncorporate proprietors as households into the business sector, but the assets and liabilities data (series X 114-147) exclude such equities because information is lacking on the value of physical assets of noncorporate business.

Apart from noncorporate equities, the assets and liabilities data give the financial asset and debt positions of households resulting from the investment flows shown by the saving and investment series.

X 114-147. Financial assets and liabilities of households, personal trusts, and nonprofit organizations, 1945-1970.

Source: See source for series X 1-23.

The total shown here for deposits and credit market instruments (series X 115) represents the household component of financial assets (series X 105) in the preceding sources of credit table. Other financial assets consist mainly of corporate equities and claims on life insurance and pension funds.

The credit market instruments liability (series X 138), comprising mainly home mortgages and consumer credit, represents the household component of debt (series X 19) shown in the summary credit table. Other liabilities are related mainly to borrowing for purchasing or carrying securities.

X 148-191. Saving and investment of households, personal trusts, and nonprofit organizations, 1946-1970.

Source: See source for series X 24-63.

Lending less borrowing in series X 114-147 is a measure of the net credit flow from households to other sectors through credit markets. Households are characteristically large net lenders to business and governments, either directly or through intermediaries (series X 165). This net lending is combined with purchases of houses, consumer durables, and nonprofit plant and equipment to give a total investment flow (series X 159) that is, by definition, equal to household saving out of current income (series X 158). Saving and investment are measured from different data sources, however, and a statistical discrepancy exists between them that is shown in series X 191. Series X 148-158 show the relation between personal saving in the national income accounts and gross saving as defined in these tables. The principal adjustments serve to capitalize outlays on consumer durables and growth of claims on government life insurance and employee retirement funds.

X 192-228. General note.

These series cover both corporate and noncorporate business, including farming. Financial sources of funds include net new share issues by corporations as well as net increases in debt claims outstanding. As equities, the share issues are excluded from the liabilities items (series X 199-206).

X 192-206. Financial assets and liabilities of nonfinancial business, 1945-1970.

Source: See source for series X 1-23.

Business financial assets (series X 192-197) are mainly liquidity balances—deposits and credit market instruments—and trade credit. Series X 193-195 are the business element of sources of funds to credit markets in series X 105. Trade credit (series X 196) is almost entirely held by and owed by business and is excluded from the credit market totals in data for debt of nonfinancial borrowers (series X 1-23) and for sources of credit market funds (series X 64-113). The largest component of miscellaneous assets (series X 197) is the direct investment position of corporations in foreign subsidiaries and branches.

Credit market debt (series X 199) is identical to series X 20. As mentioned above, most business trade debt is owed within the group to other firms. "Other" liabilities (series X 206) consist mainly of current accruals such as profit taxes accrued but not yet due.

X 207-228. Saving and investment of nonfinancial business, 1946-1970.

Source: See source for series X 24-63.

Total income before taxes (series X 207) is taken directly from the national income accounts (NIA) and consists of corporate profits and inventory valuation adjustment, proprietors' income from noncorporate business, and part of rental income of persons. Series X 207 excludes rental income that is imputed in national income accounts to owner-occupied houses. That income and all other flows associated with owner-occupied houses are included in the data for households (series X 114-191).

Business gross saving (series X 208) is mainly depreciation charges and other capital consumption allowances that are not cash outlays, but it also includes corporate retained profits after profit taxes and dividends. Noncorporate income is treated as though paid over entirely to proprietors in the household group, and no element of noncorporate retained income is included in the gross savings total. Capital expenditures (series X 211-215) are also from national income accounts (NIA) although not published in the NIA for exactly this group. Expenditures exclude purchases of houses by households, and plant and equipment outlays by nonprofit organizations and by financial business.

In almost all of the years since World War II business capital outlays have been somewhat larger than business gross saving (internal cash flow), and funds raised externally (series X 218) have been correspondingly higher than financial uses of funds (series X 217).

Series X 228 is a statistical discrepancy, the excess of gross saving over an independently measured gross investment total. An important source of this discrepancy is net land purchases, for which estimates are not yet available. These purchases are probably mainly from households and are offset by an equal and opposite element of the household discrepancy, series X 191 (see above).

X 229-262. General note.

Gross saving of State and local governments in series X 247 is the net surplus published in national income accounts less a retirement credit to households that removes employee retirement funds from this group. The retirement funds are viewed here as a form of financial institution parallel to private pension funds, and the data for State and local governments exclude their assets and activities. The basic source of information for these series is the annual surveys of governmental finances published by the Bureau of the Census. Census data are converted from a presumed mid-year fiscal basis to calendar-year estimates on the basis of quarterly data from other sources. Certain adjustments are included which integrate the financial data with national income definitions of the group and its nonfinancial transactions.

Credit market supply of funds by State and local governments included in series X 105 consists of data shown in series X 230-232. Credit market debt (series X 239) is identical with series X 18.

X 229–244. Financial assets and liabilities of State and local governments, 1945–1970.

Source: See source for series X 1–23.

See general note for series X 229–262.

X 245–262. Saving and investment of State and local governments, 1946–1970.

Source: See source for series X 24–63.

See general note for series X 229–262.

X 263–392. General note.

These financial market data series cut across a different dimension of the economy's financial structure from the preceding series. The former are statements for selected institutional groups of transactions and balance sheet positions that relate to the nonfinancial activities of these groups. The market data series, on the other hand, beginning with series X 263–275, for example, indicate for selected types of financial instruments the institutional groups that acquired the claims as assets and that issued them as liabilities. Certain items, however, from the preceding series are repeated here. Corporate bonds held by households, for example, shown in series X 128 as a form of household asset, is shown in series X 345 as one of a set of group holdings of corporate bonds that together account for all of the bonds outstanding. Except in corporate equities, the financial market series present only assets and liabilities outstanding, and net flows to or from the markets can be closely deduced from yearly changes in outstandings. Corporate equities are a special case where changes in market values cause movements in values of holdings that are very different from net transactions. Both value of holdings and net flows are shown for equities.

X 263–275. Money supply, 1945–1970.

Source: See source for series X 1–23.

Demand deposits and currency are the principal means of payment in the U.S., and the amounts held outside banks and the U.S. Government constitute the narrowly defined money supply. These data show the ownership distribution of the money supply and the banking system liability for money and Government cash balances. The figures conform to the definition of money stock as published weekly by the Federal Reserve System, but they are for a single day of the year, December 31, rather than period averages. Series X 265–267, holdings by households, business, and State and local governments are repeated here for series X 116, X 193, and X 230, respectively. Money stock is also held by nonbank financial institutions and by foreigners. These holdings are presented as they appear on the balance sheets of the holder groups. A further element of money supply, shown here as "mail float" (series X 270), is not in the balance sheets of any holders. This float is made up of checks that have been deducted from the books of the check writers but are not yet included in the books of receivers. This is a float in addition to cash items in process of collection and Federal Reserve float, both of which have been deducted already in calculating total money supply. In addition to the money supply, the series presented also include U.S. Government cash balances (series X 271), which are mainly Treasury deposits, and include, in addition, cash and currency held by other agencies.

Liability for cash balances lies partly with the Federal Reserve and certain Treasury accounts, grouped together as "monetary authorities" (series X 272) and partly with commercial banks. The monetary authorities component is mainly currency outside banks but also includes Treasury and foreign official deposits at Federal Reserve Banks and Treasury holdings of currency. The commercial bank liability consists of demand deposits held by nonbanks, after deducting cash items in process of collection and Federal Reserve float.

X 276–292. Time deposits and savings accounts, 1945–1970.

Source: See source for series X 1–23.

Commercial banking liability includes passbook savings deposits and several types of deposit with specific maturity dates. These are shown here as negotiable certificates of deposit (CD's) of $100,000 denomination or more and all others (series X 278 and X 279). The series cover ownership distributions on total time deposits, but not on negotiable CD's separately. Sources for time deposit ownership—mainly bank financial reports and corporate business statements—are inadequate for a separate allocation of CD holdings.

Deposits at nonbank savings institutions are held predominantly by households. In recent years these institutions have also started issuing certificates with stated maturities.

X 293–327. U.S. Government securities, 1945–1970.

Source: See source for series X 1–23.

The ownership estimates shown here cover all of the U.S. Government debt that appears in series X 2 except mortgages. In addition, they include the securities of federally sponsored credit agencies shown in series X 71. The sponsored-agency issues are financial intermediation that is excluded from the debt totals shown in series X 1–23, but they are part of the market for public and agency securities presented here. The sponsored credit agencies are listed in the text for series X 64–113. Almost all of the issues included here, other than sponsored agency securities, are part of public debt subject to statutory limitation, but the totals shown exclude securities held within the Government, such as by social security and civil service retirement funds, and are therefore substantially less than the total debt under ceiling, which includes these intragovernment holdings. Short-term Treasury issues (series X 296) include all marketable securities due within one year of the date shown plus a sliding proportion of those due within two years, as calculated by the Federal Reserve. "Other" Treasury issues (series X 297) are all longer-term marketable securities plus nonmarketable securities other than savings bonds. Budget agency issues and loan participation certificates (series X 299 and X 300) are borrowings by agencies other than the Treasury that became part of net borrowing from the public when the unified form of budget was introduced in 1969. Agency issues are mainly Tennessee Valley Authority and Export-Import Bank securities, and loan participations are obligations of Export-Import Bank, Government National Mortgage Association (GNMA), and a number of other agencies. They include Commodity Credit Corporation certificates up to 1970. For 1970 they also include insured notes sold by Farmers Home Administration, a form of claim that is not included in public borrowing in budget documents. Included in the totals for sponsored-agency debt outstanding are mortgage-backed securities guaranteed by GNMA.

All of the securities are shown at par values, both as liabilities and as assets. The estimates are based primarily on the Treasury Ownership Surveys that are published monthly in the *Treasury Bulletin*. Although definitions of the Government and forms of budget reporting changed substantially from 1945 to 1970 the figures shown here are all on a single definitional basis consistent with budget coverage in 1971. Sponsored-agency debt, for example, includes for all years debt of institutions that were in the group in 1971, even though some or all of the agencies were in the budget in earlier years.

While intragovernmental holdings of debt are excluded, asset holdings include Government investment in sponsored-agency issues, sponsored-agency investment in Government issues, and Federal Reserve holdings of both Treasury and agency securities (series X 302–304). Foreign holdings (series X 305) have in recent years been mainly in the hands of official institutions such as central banks.

The remaining asset holdings (series X 306) comprise the public debt held by private domestic investors and approximate the amount that must compete against other forms of credit for funds in the domestic market. Roughly one-quarter of this total is household savings bonds, Series E and H, shown on the debt side in series X 295.

Savings bonds were the major form of household Government securities for most of the period covered. For other domestic groups, holdings were predominantly marketable Treasury issues, although agency securities increased rapidly toward the end of the period. Household, business, and State and local government holdings (series X 310–312) are duplicated here for series X 121, X 195, and X 233, and in total for series X 95.

X 328–378. Bonds and mortgages, 1945–1970.

Source: See source for series X 1–23.

These data present ownership of the principal forms of private long-term credit instruments, including State and local government securities. Holdings for all groups except households are based on balance sheet tabulations by Government agencies, trade associations, or private research organizations. Household assets are in each case calculated residually by subtracting holdings reported for other groups from the totals outstanding. This procedure puts a questionable valuation on household security assets. While most of the liability totals are stated at par values, the institutional holdings subtracted are book values which represent a mixture of par, cost, and amortized cost values. The resulting distortions in household asset values are probably not large but should be borne in mind.

The totals for debt outstanding come from a variety of sources. For State and local government securities they are taken from the annual surveys of governmental finances published by the Bureau of the Census, with adjustments to shift fiscal-year totals to a December 31 basis. Borrowings by State and local governments from the Federal Government (series X 338) are removed from the total as a separate form of debt. Totals for corporate bonds outstanding are essentially cumulations of net new issues published by the Securities and Exchange Commission, starting from a base total of bonds outstanding in 1944. Foreign bonds held in the U.S. are from balance of payments statistics and are at market value. Mortgage totals are derived mainly from tabulated reports of institutional lenders, with an allowance included for lender groups not covered by the tabulations. The totals are assembled jointly by the Commerce Department, the Federal Home Loan Bank Board, and the Federal Reserve.

Mortgage debt shown for savings and loan associations consists of loans still in process of disbursement. Such loans are included in the associations' assets at their full committed amount. U.S. Government mortage debt is on residential properties acquired by the Defense Department and Coast Guard. These mortgages appear in the Treasury Ownership Survey in the *Treasury Bulletin* as "non-surveyed Government agency securities." They are included in the U.S. Government debt total (series X 2) but not in total Government securities outstanding (series X 293).

Household mortgage debt is entirely on owner-occupied residences. Nonfarm business mortgages are mainly on multi-family rental residential structures and commercial properties. They include small amounts of single-family debt that represent construction loans to builders.

X 379–392. Summary of corporate equities market, 1945–1970.

Source: Board of Governors of the Federal Reserve System, *Flow of Funds Accounts: Financial Assets and Liabilities Outstanding, 1945–1971; Flow of Funds Accounts: Annual Flows, 1946–1971;* and unpublished data.

Holdings of corporate shares are shown here at current market values, based mainly on Securities and Exchange Commission (SEC) tabulations for shares listed on stock exchanges. Movements in these values have been much larger relative to net cash transactions than for debt securities shown in preceding series, and for this market the net transactions are shown separately here. Total market values are as calculated at the Federal Reserve for all shares except open-end investment companies ("mutual funds"). The investment company total is for members of the Investment Company Institute (ICI). The totals include preferred as well as common shares. Purchases of domestic shares represent net new issues and are from the SEC and ICI. U.S. purchases of foreign shares in series X 392 represent net foreign issues, both new and existing, as shown in balance of payments publications.

For financial institutions most of the market values of holdings and net transactions are regularly reported either to trade associations or to the SEC. As in preceding series, household assets and net transactions are calculated residually. The figures indicate that in the later years shown, net purchases by life insurance companies and pension funds were larger than total new issues, while households received more from sales out of their equity portfolios than they paid for new share purchases. These net sales are shown here as negative net purchases and represent household funds transferred out of equities into other uses.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

Z Less than $50 million, or less than −$50 million.
[1] Not elsewhere classified.
[2] Capital outlays are totals for residential and nonresidential fixed capital, net change in inventories, and consumer durables, except outlays by financial business.
[3] Capital consumption includes amounts for consumer durables and excludes financial business capital consumption.
[4] Excess of net investment over net funds raised.

– Represents zero.
Z Less than $50 million.
[1] Where not shown separately, loan participations are included with agency issues.
[2] These issues are outside the budget and outside the U.S. Government sector in flow-of-funds accounts. They are included in credit market debt of financial institutions.

Chapter X

Net Public and Private Debt (Series X 393-409)

X 393–409. Net public and private debt, by major sectors, 1916–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *Survey of Current Business*, May 1969, p. 11; May 1970, p. 14; and May 1973, p. 13.

The source publications include details for the sectors shown here as well as data on gross debt.

Net debt for the public sectors of the economy represents total outstanding indebtedness minus intrasector holdings of such debt, e.g., total Federal debt minus such portions of that debt as are held by the Treasury and by Federal agencies. State and local debt includes State loans to local units. Net corporate debt represents total corporate debt minus intercompany debts of affiliated companies. Figures for the noncorporate private debt are gross, with no adjustment for intrasector holdings.

All sectors of both gross and net debt exclude (a) deposit liability of banks and banknotes in circulation, (b) value of outstanding policies and annuities of life insurance carriers, (c) short-term debt of individuals and unincorporated nonfinancial business concerns held by other individuals and unincorporated businesses, and (d) nominal corporate debt, such as bonds authorized but not issued, and issued but reacquired.

Series X 395 includes debt of Federal agencies included within the Budget. The debt of Federal agencies not included in the Budget is shown in series X 396. Series X 403 represents agricultural loans to farmers and farmers' cooperatives by institutional lenders. Series X 408 and X 409 include debt owed by farmers for financial and consumer purposes.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

[1] Net Federal debt (public and agency) is the outstanding debt held by the public as shown in *The Budget of the United States Government, Fiscal Year 1974.*

[2] Comprises the debt of federally sponsored agencies, in which there is no longer any Federal proprietary interest. Includes obligations of the Federal Land Banks, beginning 1947; debt of the Federal Home Loan Banks, beginning 1951; and debts of the Federal National Mortgage Association, Federal Intermediate Credit Banks, and Banks for Cooperatives, beginning 1968.

[3] Long-term debt has a maturity of 1 year or more; short-term debt, less than 1 year.

[4] Farm production loans and farm mortgages. Farmers' financial and consumer debt is included in the nonfarm categories.

[5] Financial debt is owed to banks for purchasing or carrying securities, customers' debt to brokers, and debt owed to life insurance companies by policyholders.

Chapter X

Money Supply and Gold (Series X 410-443)

X 410–443. General note.

The supply of money, in the sense of a means of payment, is defined broadly to include bank deposits and currency. A more restricted definition of the active money supply includes demand deposits and currency held by the public. Time deposits, including funds deposited in the Postal Savings System, have occasionally been included in the definition of the money supply. Prior to 1934, gold was also a part of the means of payment but in January of that year it was withdrawn from circulation, and, until August 1971, gold served as a means of settlement of international accounts only and, until March 1968, as a purely reserve money domestically.

As used here, the term "currency" includes coin and paper money issued by the Government and by banks. All currency is now issued by the Federal Reserve banks and the U.S. Treasury. In the series in this section three types of currency figures are shown: (*a*) Total currency stock (series X 420); (*b*) currency in circulation (series X 423–437), defined as coin and paper money outside the Treasury and Federal Reserve banks; and (*c*) currency outside banks, that is, currency in circulation less cash in the vaults of banks (series X 410).

Figures on currency in circulation have been compiled by the Treasury Department since 1800. They exclude currency held in the Treasury and Federal Reserve banks, gold and silver coin known to have been exported and, beginning January 31, 1934, all gold coin. They include currency held by the public within the United States, cash in the vaults of banks, currency lost or destroyed, and currency carried abroad and not appearing in the official gold and silver export figures.

At one time gold was the basic form into which all other types of currency could generally be converted. At present (1973–1974), however, the gold stock in most countries is held largely or entirely by central banks and Government treasuries. All gold belonging to the United States is held by the Treasury Department. Private gold holdings are forbidden except in limited amounts for licensed purposes. U.S. residents may purchase, hold, and sell domestic and foreign gold coins situated in the United States and minted before April 5, 1933. Gold coins minted after this date may be held if they have been determined to be of recognized special value to collectors. Gold may be held by Federal Reserve banks for account of foreign central banks or governments. Such earmarked gold, however, is not a part of the monetary gold stock of this country.

Prior to 1934, when gold coin and gold certificates were a part of the means of payment, they are included in series X 421, "currency held in Treasury"; series X 422, "currency in Federal Reserve banks"; and series X 423, "currency in circulation"; as well as in series X 424 and X 425, "gold coin" and "gold certificates" in circulation.

X 410–419. Money stock—currency, deposits, bank vault cash, and gold, 1867–1970.

Source: National Bureau of Economic Research, unpublished data.

See also text for series X 263–275.

Series X 410–419 are annual averages of estimates by Milton Friedman and Anna Jacobson Schwartz.

Series X 411–413 represent total deposits adjusted, i.e., total deposits less U.S. Government deposits, interbank deposits, and cash items in process of collection. A distribution showing demand and time deposits is not available prior to 1915. Figures for bank vault cash are deducted from currency in circulation to arrive at currency outside banks.

M_1 money supply, series X 414, includes currency outside the Treasury and bank vaults, demand deposits at all commercial banks, and foreign demand balances at Federal Reserve Banks. M_2 money supply, series X 415, includes all of the above plus time deposits at commercial banks. Deposits at nonbank thrift institutions are thus excluded from both M_1 money supply and M_2 money supply.

For additional descriptive detail, see Milton Friedman and Anna Jacobson Schwartz, *Monetary Statistics of the United States*, National Bureau of Economic Research (NBER), 1970.

The sources from which the estimates were derived are as follows:

X 410–416: 1867–1906 averages based on quarterly estimates from *Monetary Statistics of the United States*, tables 2 and 21; 1907–1946 averages, on end-of-month estimates from table 1 (*ibid.*), except that series X 416 is from Friedman and Schwartz, *A Monetary History of the United States, 1867–1960*, NBER, 1960, table A-2.

X 410–415: 1947–1963 averages based on monthly averages of daily figures from U.S. Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, December 1970, except that series X 411 and X 415 are from *Monetary Statistics . . .*, pp. 48–50; 1964–1970 averages based on daily figures from the *Federal Reserve Bulletin*, November 1971.

X 416: 1947–1970 averages were derived from unpublished monthly averages of the Federal Reserve Board's daily estimates.

X 417: 1869–1878 averages based on end-of-June figures from the *Annual Report of the Secretary of the Treasury*, 1928, p. 552, minus gold presumed lost (see *Annual Report*, Director of the Mint, 1907, pp. 87, 92). 1878–1913 averages based on end-of-month figures from the *Annual Report of the Secretary of the Treasury*, 1898, pp. 59 and 109; 1903, pp. 173 and 205; 1909, p. 190 (corrected for the amount of gold presumed lost); and 1915, p. 319. 1914–1946 averages derived from U.S. Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, 1943, pp. 536–538 and *Supplement*, section 14, p. 14 (for 1914–1933, plus $287 million to correct for gold presumed lost). 1947–1970 averages based on daily figures from *Banking and Monetary Statistics, Supplement 10*, pp. 16–19, and *Federal Reserve Bulletin*, monthly issues.

X 418: 1867–1906 averages based on annual or semiannual estimates in *Monetary Statistics . . .*, table 1; 1907–1946 averages derived from end-of-month estimates in table 1; 1947–1970 averages based on 12-month Federal Reserve Board estimates for the last Wednesday of the month from *Monetary Statistics . . .*, table 1, and *Federal Reserve Bulletin*, monthly issues.

X 419: 1897–1954 averages based on annual or quarterly estimates from *Monetary Statistics . . .*, table 1; 1955–1970 averages based on 12-month estimates from *Monetary Statistics . . .*, pp. 42–52, and Federal Home Loan Bank Board, *Selected Balance Sheet Data, All Operating Savings and Loan Associations.*

X 420–423. Currency stock and currency in circulation, 1800–1970.

Source: 1800–1859, U.S. Comptroller of the Currency, *Annual Report, 1896*, vol. I, p. 544; 1860–1970, U.S. Department of the Treasury, *Annual Report of the Secretary of the Treasury*, various issues.

See general note for series X 410–443.

Currency stock (series X 420) and the total of its components (series X 421–423) involve a duplication to the extent that U.S. notes, Federal Reserve notes, Federal Reserve banknotes, and national banknotes, all included in full, are in part secured by gold, also included in full. The duplication of gold certificates, silver certificates, and Treasury notes of 1890 resulting from the equal amounts of gold

or silver held as security therefore has been eliminated. For a statement on this point, see footnotes to series X 420 and X 421. A description of security and reserves by type of currency is included in the text for series X 424–437, below. The text for series X 424–437 also describes more refined estimates of gold coin in circulation, 1873–1907 and 1913–1933, which, if incorporated into series X 420–423, would require similar adjustments in "total currency in the United States" and "currency in circulation."

The *Annual Report of the Secretary of the Treasury* for 1922 and subsequent years includes the following information concerning changes in the compilation of series X 420–423. The figures for 1860–1889 have been revised from the best data available in annual reports of the Secretary of the Treasury. The records are not complete and the figures for gold and silver in those years are only estimates. Beginning with 1890, the compilation is based on revised figures for June 30 of each year and therefore differs slightly from the monthly circulation statements issued by the Treasury. The compilation reflects revisions to take account of other changes in the circulation statement, chiefly in 1922 and 1927. These revisions are explained in the *Annual Report of the Secretary of the Treasury* as follows: *1922*, p. 433; *1928*, pp. 70–71 and 551.

X 424–437. Currency in circulation, by kind, 1800–1970.

Source: U.S. Department of the Treasury. *Annual Report of the Secretary of the Treasury, 1947*, p. 543; *1961*, p. 636; *1964*, p. 598; *1967*, p. 656; and *1970*, p. 240; except series X 437, 1800–1859, *Annual Report of the Comptroller of the Currency, 1916*, vol. II, p. 45.

See general note for series X 410–443 and text for series X 420–423.

More detailed annual data on currency stock and circulation, by kind, are shown in the annual reports of the Secretary of the Treasury and the Comptroller of the Currency.

The security and reserve provisions for the different types of currency are described in the *Annual Report of the Secretary of the Treasury*, 1972, p. 245.

X 425, gold certificates. Following the enactment of the Old Series Currency Adjustment Act in 1961, gold certificates (issues prior to series of 1934) are redeemable from the general fund of the Treasury and upon redemption will be retired. Prior to 1961, gold certificates were fully secured by gold in the Treasury.

X 427, silver certificates. Originally secured by silver bullion at monetary value ($1.29+ per fine troy ounce) and standard silver dollars held in the Treasury. Since enactment of the Old Series Currency Adjustment Act in 1961, silver certificates issued before July 1, 1929, have been payable from the general fund; certificates issued on or after July 1, 1929, became redeemable from the general fund on June 24, 1968.

X 428, Treasury notes of 1890. In process of retirement since March 1900 upon receipt by the Treasury. Until 1961, secured by silver and by gold reserve; thereafter, redeemable from general fund.

X 431, Federal Reserve notes. Federal Reserve banks secure Federal Reserve notes by depositing like amounts of collateral with Federal Reserve agents. The Federal Reserve Act, as amended, authorizes the use of the following assets for this purpose: (*a*) gold certificates or gold certificate credits; (*b*) certain discounted or purchased commercial paper; (*c*) securities issued by the United States; and (*d*) Special Drawing Rights certificates issued by the Exchange Stabilization Fund. Federal Reserve notes are obligations of the United States and are a first lien on all assets of the issuing Federal Reserve Bank. Following the enactment of the Old Series Currency Adjustment Act of 1961, funds were deposited by the Federal Reserve banks with the Treasurer of the United States for the redemption of all Series of Federal Reserve notes issued before the series of 1928.

X 432, Federal Reserve banknotes. Secured at issuance by direct obligations of the United States or by commercial paper. Since termination of their issuance on June 12, 1945, the notes have been in process of retirement, and lawful money has been deposited with the Treasurer of the United States for their redemption.

X 433 U.S. notes. Secured by a gold reserve until this requirement was repealed. The Act of May 31, 1879 required that the amount of U.S. notes then outstanding, $346,681,016, be kept in circulation. The Old Series Currency Adjustment Act provided that this amount should be reduced by such amounts of notes as the Secretary of the Treasury might determine to have been destroyed or irretrievably lost. To 1970, the Secretary has made such determinations with respect to $24,142,000 of the U.S. notes issued prior to July 1, 1929.

X 434, national bank notes. Secured at issuance by direct obligations of the United States. From December 23, 1915 these notes have been in process of retirement, and lawful money has been deposited with the Treasurer of the United States for their redemption.

The monetary value of gold was changed from $20.67 per fine ounce to $35.00 per fine ounce on January 31, 1934. The weight of the gold dollar was reduced from 25.8 to 15–5/21 grains of gold, 0.9 fine.

More refined estimates of the amount of gold coin in circulation, 1873–1907, are contained in Bureau of the Mint, *Annual Report of the Director of the Mint, 1907*, p. 87; a discussion of the errors for which adjustments were made is given on pp. 66–95. For 1914–1933, the Board of Governors of the Federal Reserve System published revised estimates of gold coin in circulation (see *Banking and Monetary Statistics*, p. 409), which exclude $287 million of gold coin reported in January 1934 as still in circulation because this amount is believed to have been largely lost or melted down, or otherwise to have disappeared from circulation over the years. The Federal Reserve series has been adjusted in this way for 1914–1933; no similar adjustment has been made in the data included in this volume for gold coin in circulation, total currency in circulation, or total currency stock.

X 438–443. Changes in gold stock, 1914–1970.

Source: Board of Governors of the Federal Reserve System, 1914–1941, *Banking and Monetary Statistics*, p. 536; 1942–1957 (except series X 438 beginning 1953, X 441 beginning 1956, and X 443), *Federal Reserve Bulletin*, June 1949, p. 745, and April 1958, p. 503; **series X 439** and **X 442**, 1958–1970, unpublished data. **Series X 438**, 1953–1970, **X 440**, 1958–1970, and **X 443**, 1942–1970, *Federal Reserve Bulletin*, January issues. **Series X 441**, 1956–1970, U.S. Bureau of the Census, Report FT 2402, annual issues.

For a discussion of the items shown here, see *Banking and Monetary Statistics*, pp. 522–523. See also general note for series X 410–443.

Also available in *Banking and Monetary Statistics* and various issues of the *Federal Reserve Bulletin* are annual data on gold inflow into the United States and contributing factors, net gold imports to the United States by country, and gold production by country.

The data for domestic gold production (series X 440) are those reported by the Director of the Mint, adjusted through 1945 to exclude Philippine production received in the United States. The data for net gold imports or exports (series X 441) are those compiled by the Department of Commerce. The figures for gold under earmark (series X 442–443) represent gold held by the Federal Reserve banks for foreign and international accounts; in the calculation of the changes in gold under earmark, however, consideration has also been given to gold held under earmark abroad for the account of the Federal Reserve banks in 1917–1933.

Series X 410–419. Money Stock—Currency, Deposits, Bank Vault Cash, and Gold: 1867 to 1970

[In billions of dollars. Annual averages]

Year	Currency held by the public	Deposits adjusted, commercial banks			M_1 Money supply (currency plus demand deposits)	M_2 Money supply (M_1 plus time deposits)	Bank vault cash	Monetary gold stock	Deposits at nonbank thrift institutions

[1] Excludes gold certificates, silver certificates, and Treasury notes of 1890, since the gold and silver held as security against them are included.

[2] Prior to 1860 consists of specie only; thereafter includes coin, bullion, and paper money. Includes the following categories of currency held in Treasury as published in the circulation statement: Reserves held against U.S. notes and Treasury notes of 1890, held for Federal Reserve banks and agents, and all other money. Excludes amount held as security against gold and silver certificates and Treasury notes of 1890 since the certificates and notes are included elsewhere; for 1860–1933 they are included as currency outside the Treasury, and beginning 1934 they are included either as currency outside the Treasury or as amounts held in the Treasury for Federal Reserve banks and agents, payable in gold certificates.

[3] Agrees with source; however, figures for components do not add to total shown.

[4] Prior to 1860 the exact date of the figures is not known.

[5] Includes total stock of silver dollars and subsidiary silver, 1860–1863; and of gold coin and bullion, 1862–1863. It is not practical to present the amounts in circulation separately for the years mentioned.

[6] Estimated.

Series X 424–437. Currency in Circulation, by Kind: 1800 to 1970

[In thousands of dollars. As of June 30]

NA Not available.

[1] Beginning 1934, when Exchange Stabilization Fund was established, gold stock includes Treasury gold stock plus gold in Exchange Stabilization Fund; prior to that time represents Treasury gold stock only.

[2] Estimates of the U.S. Bureau of the Mint.

[3] Includes payment of increases in U.S. gold subscription to International Monetary Fund as follows: 1959, $344 million; 1965, $259 million; and 1970, $385 million.

[4] Excludes $259 million gold subscription to the International Monetary Fund in June 1965 for a U.S. quota increase which became effective on Feb. 23, 1966.

[5] Net after payment of $687.5 million in gold as United States gold subscription to the International Monetary Fund.

[6] Adjusted for changes in gold held under earmark abroad by the Federal Reserve banks.

Chapter X

Interest Rates and Security Markets (Series X 444-560)

X 444–560. General note.

Available statistics on interest rates and security prices indicate the cost of credit to borrowers—mainly business concerns and the Federal Government; and the income received by those who lend and invest—primarily individuals, trusts, endowments, banks, and other financial institutions. This section presents a variety of money rate and security market statistics, including principal short-term open-market rates in New York City, the discount rate of the Federal Reserve Bank of New York, commercial paper and bankers' acceptances outstanding, bank rates on short-term loans to business, bond and stock yields and prices, security issues, mutual funds, margin requirements, stock market credit, and the volume of stock exchange trading.

X 444–455. Money market rates, 1890–1970.

Source: Board of Governors of the Federal Reserve System. 1890–1941, *Banking and Monetary Statistics*, pp. 439–442, 448, 460; 1941–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," pp. 37, 48, and 50; 1964–1970, *Federal Reserve Bulletin*, monthly issues.

The rates shown here cover the most important short-term open market instruments in New York City, which is the chief money market of the country. The New York money market is composed of a number of specialized markets for certain types of borrowing and there are usually differences in rates corresponding to differences in the supply of funds relative to the demand for particular types of short-term funds in which the market deals. These markets are called "open" markets since transactions in them are usually made on an impersonal basis with the borrower and lender dealing through agents, as distinct from a "customer" market where the borrower and lender deal directly with each other and where transactions are often made on a personal basis. As a result, lenders may sell paper held, call loans, or refrain from renewing credits upon maturity more freely in the case of open-market paper than in the case of customer loans. Monthly and weekly figures for most of the series shown here are given in the source.

Rates on stock exchange loans are no longer published by the Board of Governors of the Federal Reserve System but data for these series for 1942–1962 were supplied by that agency. For stock exchange call loans (series X 447–448), a single rate only is available beginning in 1957.

Beginning 1929, a new measure of short-term rates became available with the issuance by the Treasury of a new type of security—the Treasury bill, which differs from other types of Treasury marketable securities in that it is sold on a discount basis instead of being offered in the market with a fixed coupon rate. Maturities of Treasury bills have varied up to 9 months, but usually have been 3 months. Two continuous series (X 450–451) are available beginning 1931.

The Federal Reserve Bank of New York discount rates shown (series X 454–455) are the lowest and highest rates during the year on discounts for and advances to member banks under sections 13 and 13a of the Federal Reserve Act. For the period prior to 1921, when a multiplicity of rates prevailed, discount rates on paper of a single class and maturity—usually the type of paper and maturity for which the rate was lowest—are shown. Specifically, from November 16, 1914, the day the Reserve Banks opened, through August 1916, the rate applies to discounts of commercial, agricultural, and livestock paper with maturities of from 31 to 60 days; and from September 1916 to December 1920, to discounts of, and advances secured by, commercial, agricultural, and livestock paper with maturities of 15 days or less. Rates also apply to advances secured by obligations of Federal intermediate credit banks maturing in 6 months. For 1942–1945, the low rate shown is the preferential rate for advances secured by Government securities maturing or callable in one year or less. In this period the rate of 1 percent was continued for discounts of eligible paper and advances secured by such paper or by U.S. Government obligations with maturities beyond 1 year. The discount rates at all Federal Reserve banks and a description of the series through 1941 is contained in *Banking and Monetary Statistics*, pp. 422–424, 439–442, and thereafter in the *Federal Reserve Bulletin*.

X 456–465. Commercial and finance company paper and bankers' acceptances outstanding, 1918–1970.

Source: Board of Governors of the Federal Reserve System. 1918–1941, *Banking and Monetary Statistics*, pp. 465–467; 1942–1952, *Federal Reserve Bulletin*, February 1944, p. 170; January 1946, p. 59; February 1953, p. 146; and 1953–1970, *Federal Reserve Bulletin*, May issues.

Prior to 1948, figures for commercial paper represent the amount of paper outstanding as reported by the principal commercial paper dealers in the country. Some finance company paper sold in the open market is included. Beginning 1948, figures are for commercial paper and finance company paper combined, shown by method of placement. These data represent paper with an original maturity of 9 months or less (including some finance company paper sold in open markets) as reported by a varying number of dealers. Finance company paper placed directly with investors represents the amount reported by a varying number of finance companies. Prior to 1958, a small amount of finance company paper with an original maturity of more than 270 days was included; thereafter, all paper in this maturing group is included.

Figures for bankers' acceptances are amounts outstanding as reported by makers of bankers' acceptances, including banks and bankers in the United States and agencies of foreign banks in this country.

X 466–473. Bank rates on short-term business loans, 1919–1966.

Source: Board of Governors of the Federal Reserve System. 1919–1938, *Banking and Monetary Statistics*, pp. 463–464; 1939–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," p. 61; 1964–1966, *Federal Reserve Bulletin*, March issues.

Data by months through 1938 and by quarters thereafter are available in the source publications. These data are compiled by the Board of Governors from reports submitted by member banks in leading cities throughout the country.

The reporting cities are representative financial centers having large loan markets. Interest rates charged by banks in these cities are more responsive to changes in general monetary conditions than are rates in other places. Because of the financial importance of the cities, their influence would predominate in any compilation designed to show movements of interest rates in large cities.

Figures for series X 470–473 represent averages of prevailing rates reported monthly by banks in a varying number of leading cities on commercial loans and time and demand security loans. These figures are not strictly comparable with those in series X 466–469 but they are believed to represent bank rates on business loans. For series X 466–469, the figures for 1928–1938 are averages of prevailing rates reported monthly by banks in 19 principal cities on

business loans only; beginning in 1939, the figures are averages of interest rates charged by banks in the 19 cities on short-term business loans made during the first half of March, June, September, and December. For a description of the figures prior to 1939, see *Banking and Monetary Statistics*, pp. 426–427; beginning 1939, see *Supplement to Banking & Monetary Statistics*, pp. 9–11. Beginning 1948, the source publication includes data on average interest rates by size of loan.

In 1967, these series were revised for expanded coverage. The new series cover new loans and loan renewals made during the first half of the middle month of each calendar quarter. The number of financial centers covered by the survey has been raised from 19 to 35 and the number of respondent banks from 66 to 126. For further details, see *Federal Reserve Bulletin*, May 1967.

X 474–486. General note.

In addition to the sources cited for each individual series, these data (except series X 476 and X 479–482) appear also in U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *Survey of Current Business*. Beginning with the January 1962 issue, the annual figures for the two most current years appear in every issue. Annual data back to 1947 appear in the 1971 edition of *Business Statistics*, a supplement to the *Survey*.

X 474. Yields on U.S. Government bonds, 1919–1970.

Source: Board of Governors of the Federal Reserve System. 1919–1941, *Federal Reserve Bulletin*, May 1945, p. 483; 1941–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," p. 68; 1964–1970, *Federal Reserve Bulletin*, January issues.

Figures are unweighted averages of yields. For 1919–1925, yields cover all outstanding partially tax-exempt Government bonds due or callable after 8 years; for 1926–1934, all such bonds due or callable after 12 years; for 1935–1941, all such bonds due or callable after 15 years. For further description of the series, see *Banking and Monetary Statistics*, p. 429, and *Federal Reserve Bulletin*, May 1945, pp. 483 and 490. Beginning 1942, the series is for fully taxable bonds. Yields cover 1942–March 31, 1952, the bonds due or callable after 15 years; April 1, 1952–March 31, 1953, due or callable after 12 years; April 1, 1953–1970, due or callable in 10 years or more.

X 475. Municipal high-grade bond yields, 1900–1970.

Source: Standard and Poor's Corporation, Trade and Securities Statistics, *Security Price Index Record*, New York, 1971 edition (copyright).

Prior to 1929, this series is an arithmetic average of the yield to maturity of 15 high-grade municipal bonds, based on the mean of monthly high-low prices. Beginning 1929, the series is an average of the 4 or 5 weekly indexes for the month. Annual figures are averages of monthly data. Monthly and weekly data are available in the source.

X 476. Unadjusted index number of yields of American railroad bonds, 1857–1936.

Source: Frederick R. Macauley, *Some Theoretical Problems Suggested by the Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, 1938, pp. A 142–161 (copyright).

The railroad industry was selected as the basis for a longtime study of bond yields because no other industry had securities of comparable importance as early as 1857, and for many years no other industry had as high a credit rating. The series is available before and after adjustment to eliminate economic drift due to secular changes in the quality of the bonds included. The unadjusted series is more comparable with currently available series. The series is a chain index number based on the arithmetic average of yields on long-term high-grade railroad bonds. Yields for individual bonds are based on arithmetic averages of monthly high and low sale prices. With a few exceptions the index includes no bonds with maturities under 10 years, and since 1909 the minimum has been 14 years. The number of bonds on which the index is based was 13 in 1857 and increased gradually to 37 in 1900; it varied between 36 and 45 until 1930 and declined to about 28 in 1935. Annual figures are averages of monthly data.

X 477. Corporate Aaa bond yields, 1919–1970.

Source: Moody's Investors Service, *Moody's Industrial Manual*, New York, 1971 edition, p. a18 (copyright).

This series is an unweighted arithmetic average of the yields for individual bonds, based on closing prices. Prior to 1928, yields are based on the average of the month's high and low sale price for each bond; for 1928 and 1929, on biweekly closing quotations; for 1930 through October 1931, on weekly quotations; beginning November 1931, on daily closing quotations. Annual figures are averages of monthly data.

X 478. Yields on preferred stocks, 1910–1970.

Source: See source for series X 475.

For January 1910–January 1928, this index is computed from the average of the monthly high and low prices of 20 high-grade issues. All prices are converted to a price equivalent to $100 par and a $7 annual dividend before averaging. The yield index is computed from the average price. Beginning February 1928, the index is based on an average of the weekly yields, which are based on Wednesday's closing quotations for 15 (14 from April 1948–September 1965 and 10 thereafter) high-grade noncallable issues. The yield is determined for each issue and the average of the 9, 8, and 4 median yields, respectively, represents the group yield. Annual figures are averages of monthly data.

X 479–482. Yields on common stocks (Cowles Commission), 1871–1937.

Source: Alfred Cowles and Associates, *Common Stock Indexes, 1871–1937*, Principia Press Inc., Bloomington, Ind., 1939, pp. 372–373.

Yields are total actual dividends paid in each calendar year divided by total stock values as represented by an average of the monthly values for the year. The data employed in the construction of this index include, for 1871–1917, all industrial and public utility common stocks, and about 93 percent in market value of the railroad stocks traded on the New York Stock Exchange. The stocks and the periods of their inclusion are given in appendix II of the source volume. Subsequent to 1917 (in some cases 1926 or later) the stocks included in the Standard Statistics weekly indexes are used, which represent 90 percent of all common shares listed on the New York Stock Exchange. For further description of the indexes, see the source volume, pp. 1–50.

X 483–486. Yields on common stocks (Moody's), 1929–1970.

Source: Moody's Investors Service, *Moody's Industrial Manual*, New York, 1971 edition, p. a28 (copyright).

Annual figures are averages of monthly data which are dividends at annual rates based on latest company declarations divided by end-of-month prices.

X 487–491. Basic yields of corporate bonds, by term to maturity, 1900–1970.

Source: 1900–1942, David Durand, *Basic Yields of Corporate Bonds, 1900–1942*, New York, 1942 (copyright); 1943–1955, National Bureau of Economic Research, unpublished data; 1956–1970, Scudder, Stevens, and Clark, New York, unpublished data. Series published monthly in U.S. Bureau of Economic Analysis, *Survey of Current Business*.

Greater detail than is shown here as to yield by years to maturity appears in Durand's volume.

Through 1950, the basic yield series represent the yields estimated as prevailing in the first quarter of each year on the highest grade corporate issues, classified by term to maturity; thereafter, the yields estimated in February only. These series are based on monthly high and low quotations of practically all the actively traded high-grade corporate issues outstanding since 1900.

X 492. U.S. Government bond prices, 1919–1970.

Source: Board of Governors of the Federal Reserve System. 1919–1940, *Federal Reserve Bulletin*, May 1945, p. 483; 1941–1963, *Supplement to Money and Banking Statistics*, section 12, "Money Rates and Securities Markets," p. 98; 1964–1970, *Federal Reserve Bulletin*, January issues.

Prior to 1942, the prices are derived from average yields of partially tax-exempt bonds shown in series X 474 on the basis of a 4 percent 16-year bond through December 1930 and on the basis of a 2¾ percent 16-year bond for 1931–1941. For further description of the series, see *Banking and Monetary Statistics*, p. 429.

For 1942–March 31, 1952, figures for fully taxable issues are average prices of bonds due or first callable after 15 years; for April 1, 1952–March 31, 1953, average prices of fully taxable marketable 2½ percent bonds first callable after 12 years; beginning April 1, 1953, prices are derived from average yields on the basis of an assumed 3 percent 20-year bond. The yield averages used are those on bonds maturing or callable in 10 years or more.

X 493–494. State and local government and corporate Aaa bond prices, 1900–1970.

Source: See source for series X 475, pp. 203 and 224.

The prices are a conversion of the yield indexes, assuming a 4-percent coupon with 20 years to maturity. For a description of the yield series for high-grade State and local government bonds, see text for series X 475. The corporate Aaa bond series is based upon the following: For 1900–1928, the monthly high-low price of 45 high-grade corporate bonds; for 1929–March 1937, a varying group of A1+ bonds, one price monthly (first of month); beginning April 1937, the average of the weekly A1+ indexes. Annual data are averages of weekly figures.

X 495–498. Index of common stock prices, 1871–1970.

Source: See source for series X 475.

These indexes, which are based on the aggregate market value of the common stocks of all the companies in the sample, 500 stocks for all years (425 industrial, 25 railroad, and 50 public utility), express the observed market value as a percentage of the average market value during the base period. From January 1908 to date, these indexes are based on monthly averages of the Standard and Poor's stock price indexes. The indexes for earlier years have been converted to the 1941–43 base from the Cowles Commission stock price indexes, which are an extension of the Standard and Poor's indexes. The same method of construction was used for both, and, as far as possible the same companies. The formula used for this index is generally defined as a "base-weighted aggregative" expressed in relatives with the average value for the base period (1941–43) equal to 10 and with adjustments for arbitrary price changes caused by the issuance of rights, stock dividends, splitups, etc.

X 499–509. Security issues and net change in outstanding corporate securities, 1934–1970.

Source: U.S. Securities and Exchange Commission, *Annual Report, 1952*, pp. 210–221, and *1958*, pp. 208–216; and *Statistical Bulletin*, May 1958, pp. 9–11, and subsequent issues; except series X 507–509, prior to 1960, unpublished data.

The data for series X 499–506 cover substantially all new issues of securities offered for cash sale in the United States in amounts over $100,000 and with terms to maturity of more than one year. Figures include issues privately placed and publicly offered, whether unregistered or registered with the Securities and Exchange Commission.

The figures for privately placed issues include securities actually issued but exclude securities which institutions had contracted to purchase but had not actually taken during the period covered by the statistics. Also excluded are intercorporate transactions; U.S. Government "Special Series" issues, and other sales directly to Federal agencies and trust accounts; notes issued exclusively to commercial banks; and corporate issues sold through continuous offering, such as issues of open-end investment companies. Issues sold by competitive bidding directly to ultimate investors are classified as publicly offered issues. The figures for new capital include all issues other than those whose proceeds are intended to be used for retirement of securities already outstanding.

The figures for series X 507–509 on net change in outstanding corporate securities are derived by deducting from estimated gross proceeds received by corporations through the sale of securities the amount of estimated gross payments by corporations to investors for securities retired. Included in the latter figures are payments for issues retired with internal funds as well as with proceeds from new issues sold for refunding purposes. These series are based primarily on cash transactions but include conversions and exchanges of one type of security for another, e.g., bonds for stocks.

X 510–515. Corporate security issues, 1910–1934.

Source: 1910–1918, U.S. Bureau of Foreign and Domestic Commerce, *Statistical Abstract of the United States, 1932*, p. 292; 1919–1934, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 487.

The *Commercial and Financial Chronicle* data used for these series, for 1919–1934, include all security issues publicly offered for sale by companies incorporated in the United States. Securities sold privately were included when the compilers were aware of the sale. Issues of foreign companies sold in the United States are excluded. Data are based on the offering price for preferred stock of no par value and for common stock, and on par amounts for bonds, notes, and preferred stock with stated par value. The data prior to 1919 include offerings of foreign corporations.

These series differ from those compiled by the Securities and Exchange Commission (series X 499–506) in a number of respects. The latter include issues on the basis of gross and/or net proceeds, whereas the *Chronicle* series include issues on the basis noted above. The *Chronicle* series include issues for exchange purposes, while the SEC figures include only that portion of such an offering that is sold for cash. The SEC series also include foreign corporate security issues sold in the United States, while the *Chronicle* series exclude them except for the period noted. The basis for inclusion of privately sold securities also differs.

X 516. New State and local government security issues, 1919–1970.

Source: Board of Governors of the Federal Reserve System, 1919–1933, *Banking and Monetary Statistics*, p. 487. U.S. Securities and Exchange Commission, 1934–1945, *Annual Report, 1952*, part 3, p. 211. Board of Governors of the Federal Reserve System, 1946–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," p. 166; 1964–1970, *Federal Reserve Bulletin*, January issues.

Data represent principal amounts of securities offered publicly for sale in the United States by all political subdivisions either for new money or for refunding, retiring, or otherwise acquiring existing securities. They include loans from the U.S. Government. For 1919–1933, figures are as compiled and published by the *Commercial and Financial Chronicle*; for 1934–1956, they are from totals published

by the *Chronicle* and the *Bond Buyer*; beginning 1957, the figures are compilations of the Investment Bankers Association of America.

X 517–530. Market value and volume of sales of stocks and bonds on registered securities exchanges, 1935–1970.

Source: U.S. Securities and Exchange Commission, *Statistical Bulletin*, annual data in various issues (February, March, or April).

The data presented in these series are of two types depending upon the method of aggregation used by each exchange. Reports of some exchanges cover transactions cleared during the calendar month; clearances occur for the most part within five days of the execution of a trade. Reports for other exchanges cover transactions effected on trade dates falling within the report month. The variance introduced by these two different methods of aggregating the data is not considered to be significant and accordingly all registered exchanges are aggregated and reported in monthly summaries.

Stock data include voting trust certificates, certificates of deposit for stocks, and American Depository Receipts for stocks. Bond data have excluded transactions covering United States Government issues since March 1944. Warrants data include trading in rights for all periods.

X 531–535. Volume of sales on New York Stock Exchange, 1900–1970.

Source: 1900–1909, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 485; 1910–1970, *Commercial and Financial Chronicle*, New York.

Data on stocks (series X 531) show the volume of share trading in round lots on the New York Stock Exchange, as reported by the Exchange ticker; this series excludes odd lots, stopped sales, private sales, split openings, crossed transactions, and errors of omission. Data on bonds are exclusive of stopped sales and, beginning in July 1947, include bonds of the International Bank for Reconstruction and Development.

X 536–539. Net assets, sales, and redemptions of mutual funds, 1940–1970.

Source: Investment Company Institute, Washington, D.C., *Mutual Fund Fact Book, 1970*, and *Statistical Work Book*, No. 19.

A mutual fund may be defined as a company which combines the funds of many investors whose investment goals are similar, and in turn invests those funds in a wide variety of securities. The selection, purchase, and sale of individual securities by the mutual fund are conducted under the supervision of professional managers. Different mutual funds have a variety of investment objectives, management policies, and degrees of risk. Some funds place strong emphasis on capital growth; others stress current income or a balance between growth and income; some are highly speculative.

Most mutual funds are technically known as open-end investment companies because they stand ready at any time to redeem outstanding shares upon request by the investor. As open-end companies, the number of their shares is not fixed, with the outstanding total varying as new shares are sold to investors and shares are redeemed by investors upon presentation to the company. Shares are generally available from investment dealers or fund sales representatives. In most cases, the offering price includes a sales charge of 7½ to 8½ percent, with lower rates applying on larger purchases. The redemption price is generally the net asset value prevailing at the time the shares to be redeemed are received by the company. The net asset value per share is determined by most companies at least once a day, and is computed by dividing the current market value of the company's total net assets by the number of its shares outstanding.

The origin of investment companies and the concept of diversification date well back into the 19th century. However, most of the growth in mutual funds in the United States, in both the number of companies and total assets, has occurred since World War II, and particularly in the 1950's and 1960's. Growth in net assets over the years has been due not only to excess of share purchases over redemptions, but also to the long-term uptrend in market value of securities in which the mutual funds invest.

Mutual funds are regulated by both Federal and State governments. The major Federal statutes regulating investment companies are the Securities Act of 1933, the Securities Exchange Act of 1934, and the Investment Company Act of 1940. The latter regulates the creation and structure and many of the operations of investment companies. The Federal Acts are administered by the Securities and Exchange Commission.

X 540–542. Federal Reserve Board margin requirements, 1934–1970.

Source: Board of Governors of the Federal Reserve System, 1934–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," p. 141; 1964–1970, *Federal Reserve Bulletin*, January issues.

Regulations T and U, administered by the Federal Reserve Board, limit the amount of credit that may be extended on a security by prescribing a maximum loan value, which is a specified percentage of its market value at the time of extension; the "margin requirements" shown are the differences between the market value (100 percent) and the maximum loan value.

X 543–546. Stock market credit, 1931–1970.

Source: Board of Governors of the Federal Reserve System. 1931–1937, *Banking and Monetary Statistics*, p. 501; 1938–1963, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," pp. 142–146; 1964–1970, *Federal Reserve Bulletin*, January issues.

Series X 543–545 relate to credit extended by stock brokers on the basis of reports made by a group of firms estimated to account for at least 90 percent of total credit extended by security brokers and dealers in the United States. Data for 1931–1934 are estimates based on data collected by the New York Stock Exchange, and for 1935–1970 are based on reports collected by the Federal Reserve Board. Customers' debit balances represent credit extended by brokers to their customers, and money borrowed represents most of the credit obtained by these brokers, including money borrowed against customer collateral as well as that for their own activities. Customers' free credit balances represent customers' funds held by brokers pending investment or pending remittances to customers.

Customer credit in the stock market (series X 546) is defined as the sum of customers' net debit balances of the reporting firms, exclusive of those secured by U.S. Government obligations, and bank loans to others than brokers and dealers for purchasing and carrying securities exclusive of U.S. Government securities. As a result of changes in reporting, this series is not entirely comparable. Prior to 1955, customers' net debit balances include balances secured by U.S. Government obligations. Bank loans to others for purchasing and carrying securities are figures of weekly reporting member banks for the last Wednesday of the year, a series beginning in 1938. At the end of 1970 these banks accounted for about seven-tenths of all loans for this purpose. Loans for purchasing and carrying U.S. Government securities are excluded for all reporting banks for 1944–1952, and for reporting banks in New York City and Chicago for 1953–1970. For further details concerning the series, see *Banking and Monetary Statistics*, pp. 435 and 437–438, and *Supplement to Banking & Monetary Statistics*, pp. 18–20.

X 547–550. Brokers' loans, by groups of lenders, 1918–1938.

Source: Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 494.

These data were assembled from various sources and, where gaps occurred, estimates were made. The figures represent loans to brokers by principal groups of lenders—New York City banks, outside

banks, and others. Other lenders comprise foreign banking agencies, corporations, other brokers, and individuals. The figures cover primarily loans to brokers and dealers in New York City, most of whom are members of the New York Stock Exchange, but they include also loans to certain investment banking houses that do not have Stock Exchange seats and to brokers and dealers belonging to other stock exchanges. Comparable data are not available after 1938. For a more detailed description of the series, see *Banking and Monetary Statistics*, pp. 434–435.

X 551–560. Short- and intermediate-term consumer credit, by major types, 1919–1970.

Source: Board of Governors of the Federal Reserve System, 1919–1955, *Supplement to Banking & Monetary Statistics*, section 16 (new), "Consumer Credit," p. 33; 1956–1970, *Federal Reserve Bulletin*, monthly issues.

Short- and intermediate-term consumer credit includes credit used to finance the purchase of commodities and services for personal consumption or to refinance debt originally incurred for such purposes. It also includes credit extended to individuals for the purchase of consumer goods that may be used in part for business.

Installment credit, series X 552–556, represents all consumer credit that is scheduled to be repaid in two or more payments. Revolving credit, budget, and coupon accounts are treated as installment credit rather than as charge accounts because they provide for scheduled repayment on a periodic basis. Published estimates of the amount of installment credit outstanding generally include the financing charges on such credit and the cost of insurance or other fees included in the credit contract.

Automobile paper, series X 553, represents credit extended for the purchase of new or used automobiles, whether or not the credit is specifically secured by the automobile purchased. Similarly, "other consumer goods paper," series X 554, represents credit extended for the purchase of such nonautomotive consumer goods as home appliances and furniture, jewelry, mobile homes, and boats.

Automobile credit and other consumer goods credit often are extended to the consumer by a retailer; sometimes the retailer will hold the paper for his own account, but in many instances he will sell it to a sales finance company, a commercial bank, or some other financial institution. In other instances installment paper represents loans made directly by lending institutions to consumers for the purchase of goods and services.

Repair and modernization loans, series X 555, include both Federal Housing Administration-insured credit and noninsured credit extended to consumers to finance the maintenance and improvement of their homes. Such credit may be used for the purchase and installation of equipment, such as heating and air-conditioning systems, hot water heaters, storm windows, and kitchen equipment, as well as for major alterations and additions.

Personal loans, series X 556, include all installment loans not covered in the previous categories that are made by financial institutions to individuals for consumer purposes. Many of these loans are obtained for the consolidation of consumer debts, for the payment of medical, educational, or travel expenses, and for the payment of taxes or insurance premiums. Some loans used for the purchase of automobiles or other consumer goods may be classified as personal loans because the lender cannot identify them with purchases of specific goods.

Noninstallment credit, series X 557–560, consists of those forms of consumer credit that are scheduled to be repaid in a lump sum.

Single-payment loans, series X 558, are noninstallment loans made directly to individuals for consumer purposes. Some credit of this type is used for the purchase of goods, but most is for meeting short-term needs such as for the payment of personal taxes or life insurance premiums.

Charge accounts, series X 559, represent noninstallment balances owed to retail outlets for purchases made by consumers. These are open accounts ordinarily payable in full within 30 days of billing. The charge-account segment also includes the amounts consumers owe on accounts at gasoline service stations or on miscellaneous credit-card accounts and on home-heating-oil accounts. Such indebtedness differs from other charge-account credit in that it does not take the form of outstanding balances on the books of retail outlets.

Service credit, series X 560, consists of the amounts owed by consumers to professional practitioners and service establishments. The largest element in service credit is the amount owed to doctors, hospitals, and other suppliers of medical services. Amounts owed to public utilities, less deposits and prepayments, are also substantial. The remainder of service credit represents amounts owed for a wide variety of services, including education, recreation, and such personal services as laundry, cleaning, and dyeing.

Estimates are described in the *Federal Reserve Bulletin* for December 1968 and October 1972. They are based for the most part on sample reports submitted monthly and are adjusted periodically to more comprehensive data. Figures prior to 1940 are based largely on estimates of the Department of Commerce.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

[1] Averages of weekly prevailing rates through 1934; averages of the most representative daily offering rates quoted by dealers thereafter.

[2] Averages of the most representative daily offering rates published by finance companies, for varying maturities in the 90–179 day range.

[3] Seven-day average for week ending Wednesday.

[4] Yields are averages computed from daily closing bid prices.

[5] Bills quoted on bank discount rate basis.

[6] Data for prior years not comparable; series includes the new bill issue the day following the auction, as trading begins on a when-issued basis.

[7] Preferential rate on advances secured by Government securities; see text.

[8] Includes 1 or more interpolated items.

– Represents zero.

[1] Prior to 1948, total for commercial paper only represents paper maturing within 7 months as reported by principal paper dealers; thereafter, figures for commercial paper and finance company paper combined by method of placement represent paper with an original maturity of 9 months or less as reported by varying number of dealers.

[2] Includes paper placed through banks, not shown separately.

[1] Excludes balances with reporting firms of other member firms of major security exchanges and balances of the reporting firms and of general partners of the reporting firms. Figures for November 1931 to August 1935, inclusive, are estimates based on data made available through the courtesy of New York Stock Exchange; such estimates are available only for "Customers' debit balances" and for "Customers' free credit balances."

[2] Includes money borrowed from banks and trust companies in New York City and elsewhere in U.S. and also money borrowed from other lenders (not including members of national securities exchanges). Prior to September 1935, figures reported on a different basis.

[3] For an explanation of this series, see text. [4] Series discontinued June 1970.
[5] Data not comparable with prior years because of change in series.

Chapter X

Banking (Series X 561-820)

X 561–820. General note.

For general statistical purposes it may be said that a bank is a financial institution which accepts money from the general public for deposit in a common fund, subject to withdrawal or transfer by check on demand or on short notice, and makes loans to the general public. The historical series on assets and liabilities of banks reflect these activities and are the basic series on banking. Series X 561–619 and X 634–688 on principal assets and liabilities of banks and on number and total assets by class of bank cover all banks and all commercial banks. Series X 620–633 and X 689–697 provide information on selected aspects of banking: Insured banks, branch banking, suspension of banks, earnings and expenses, bank debits and clearings, savings deposits, and Federal Reserve banks.

Collection and publication of banking and monetary statistics in the United States have been conditioned by the development of the banking and monetary system. Banks in this country have been in part under the jurisdiction of State governments and in part under the Federal Government. At the same time some banks operated before 1933 outside the jurisdiction of both governments, while other banks operated within the jurisdiction of both.

Supervision and regulation of banks have been a primary responsibility of the chartering authority. National banks, organized under Federal law enacted in 1863, are supervised by the Comptroller of the Currency, and State banks, by officials of the respective States.

Two other Federal entities with additional supervisory authority have been superimposed upon the existing banking structure: The Federal Reserve System, established in 1914 to exercise central banking functions, and the Federal Deposit Insurance Corporation, created in 1933 to insure bank deposits. The Federal Reserve System includes all national banks and such State banks as voluntarily join the System. Insurance of bank deposits was made obligatory for banks belonging to the Federal Reserve System and optional for others.

All the supervisory agencies have published some statistics for the banks under their jurisdiction, but there was no centralized collection of statistics for all classes of banks on a uniform basis until 1947. Prior to the National Banking Act of 1863, the only official collection of banking figures for the entire country was made by the Treasury Department under authority of a resolution of the House of Representatives passed in 1832. For 1833–1863, reporting by banks to the Secretary of the Treasury was voluntary. With the exception of some years, the Secretary of the Treasury included in his reports to Congress information regarding the number of State banks which reported to him. For 1863–1873, statistics of national banks only were published in the *Annual Report of the Comptroller of the Currency.*

The need for complete reporting was recognized in the act of 1873, which authorized the Comptroller to obtain balance-sheet data for nonnational banks from State banking authorities, Territorial authorities, or individual incorporated banks. Although coverage was improved, the data obtained were neither uniform nor complete because the various State and Territorial authorities did not request the same information from banks and some States had no department to collect the information. Moreover, in some States many so-called private or unincorporated banks operated outside the jurisdiction of State authority. The Comptroller annually requested that these banks report directly to him, but this procedure met with only limited success.

In spite of the difficulties of collecting statistics for all banks, the coverage and uniformity of the data became progressively better. This improvement came about principally because of greater uniformity in classification of balance-sheet information requested of banks, and because of the creation of banking departments in States that formerly had none, as well as more adequate collection and tabulation of data.

Efforts to promote uniformity in bank statistics culminated in 1938 when representatives of all Federal supervisory agencies worked out a standardized balance-sheet report form. This form was approved by the National Association of State Bank Supervisors and was adopted by the three Federal banking agencies and by many of the State banking departments. Nearly all States now use a form that is substantially consistent with the standard one.

In 1947, the Comptroller of the Currency, the Board of Governors of the Federal Reserve System, and the Federal Deposit Insurance Corporation, which compiled somewhat different balance-sheet data for all banks, worked out an arrangement for the Federal Deposit Insurance Corporation to compile semiannually a uniform series of statistics for all banking institutions.

To provide more adequate historical banking statistics comparable to those available beginning in 1947, the Board of Governors of the Federal Reserve System—with the cooperation of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the State bank supervisory authorities—compiled a revised series for all banks in conterminous United States as of June 30 of each year, 1896–1955. These data were published in 1959 in Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955.* The series cover number of banks and principal assets and liabilities for major classes of banks. The publication also includes similar data for individual States, and for the U.S. outlying areas, which are not included in U.S. totals. Revisions in the earlier data affect primarily the nonnational components, and are largest for figures before 1920.

Compilation of the revised series for national banks presented no major problems. Since 1864, the Comptroller of the Currency has collected condition reports from 3 to 6 times annually from national banks, and has tabulated and published summaries of these reports showing principal assets and liabilities. National bank balance-sheet data were published in detail in *Abstract of Reports of Condition of National Banks* (usually 3 or 4 times a year) through 1962. Assets and liabilities and income and expense data are published in summary form in the *Annual Report.*

Compilation of revised statistics for nonnational banks beginning in 1896 required extensive research into all types of available banking statistics. The main sources of information, other than the records of several large private banks, were the annual reports and statistical publications and records of the Comptroller of the Currency, the Bureau of Internal Revenue, the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and State banking departments, as well as compilations published in bankers' directories. Unofficial compilations of figures for banks in several States were also used.

Under the arrangements made for all-bank data beginning with 1947, the 1947–1955 data in Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955,* were based on compilations of the Federal Deposit Insurance Corporation, except that data for "other areas," that is, the U.S. outlying areas, were included in U.S. totals.

A financial institution is considered a bank in the revised all-bank series if it accepts deposits from the general public or if it conducts principally a fiduciary business. This is the definition used by the Comptroller of the Currency, the Federal Deposit Insurance Corpora-

tion, and the Board of Governors of the Federal Reserve System in the all-bank statistics published beginning with 1947. For complete description of the types of institutions included and of those excluded, see Federal Deposit Insurance Corporation, *Annual Report, 1956*, pp. 88–89.

In 1969, the format and contents of the uniform quarterly Report of Condition and the annual Report of Income, adopted in 1947 by Federal bank supervisory agencies and used by banks in the United States, were substantially revised to provide a better measure of bank performance for the supervisory authorities and the public. Changes in these two reports were effected following extensive discussions among representatives of the Federal and State bank supervisory authorities and the banking industry. For a description of these changes, see the *Federal Reserve Bulletin*, August 1969, pages 642 ff. (Report of Condition) and the July 1970 issue of the *Bulletin*, pages 571–2 (Report of Income).

Beginning June 30, 1969, the three Federal bank supervisory agencies have issued jointly—as of the end of June and December of each year—aggregate data showing the major call report items for all banks in the United States grouped by class, size, and geographic location. This combined report entitled *Assets and Liabilities—Commercial and Mutual Savings Banks* replaces the summary reports of condition formerly issued separately by each of the Federal bank supervisory agencies. The Federal Deposit Insurance Corporation has compiled, beginning in 1969, comprehensive income and end-of-year balance-sheet information for all insured commercial banks grouped by class, size, and geographic location in a report entitled *Bank Operating Statistics*.

X 561–688. General note.

Assets and liabilities are defined here in their usual accounting meaning. Assets are the resources of banks, such as loans, investments, reserves, cash, and balances with other banks; liabilities are the obligations of banks, such as demand and time deposits and capital accounts. The data presented in series X 580–619, X 634–677, and X 683–688, prior to 1956, are for conterminous United States; thereafter, they include Alaska, Hawaii, and U.S. outlying areas.

X 561–565. State banks—number of banks and assets and liabilities, 1811–1830.

Source: *Writings of Albert Gallatin*, edited by Henry Adams, J. B. Lippincott and Company, Philadelphia, 1879, vol. III, pp. 286, 291, and 296.

These are believed to be the most consistent series for the period before 1834. The figures are reprinted in Comptroller of the Currency, *Annual Report, 1876*, p. xl, which also contains estimates derived from an unofficial source of the number of banks, specie holdings, banknote circulation, and capital of banks in the United States for selected years, 1774–1804, and some discussion of early banking statistics. Figures in the Comptroller's report for 1876, together with some additional banking data for the period prior to 1834, are included in Comptroller of the Currency, *Annual Report, 1920*, vol. 2, p. 846.

X 566–579. Second Bank of the United States—resources, liabilities, and profits, 1817–1840.

Source: **Series X 566–577**, U.S. Comptroller of the Currency, *Annual Report, 1876*, app. p. lxxxiii (except series X 577 for 1818–1837, *Annual Report, 1916*, p. 912); **series X 578–579**, Ralph C. H. Catterall, *The Second Bank of the United States*, University of Chicago Press, Chicago, 1903, p. 504.

The Second Bank was chartered by Congress in 1816 for 20 years. Renewal of the charter was denied and reorganization of the bank was effected by the Legislature of the State of Pennsylvania. The bank failed in 1841 and was finally liquidated in 1856. See headnote, table 94, p. 912, Comptroller of the Currency, *Annual Report, 1916*, vol. II; that page also shows assets and liabilities of the First Bank of the United States in 1809 and 1811, the only two years for which data appear to be available.

X 580–587. All banks—number of banks and principal assets and liabilities, 1834–1970.

Source: 1834–1896, U.S. Comptroller of the Currency, *Annual Report, 1931*, pp. 1018–1025; 1896–1955, Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955*, pt. I, pp. 30–33; 1956–1970, U.S. Federal Deposit Insurance Corporation, *Annual Report*, various issues.

These series represent a combination of data on two different bases: For 1896–1970, on the revised all-bank series basis and for 1834–1896, on the basis published in annual reports of the Comptroller of the Currency, which is known to provide incomplete coverage, especially of nonnational banks.

The historical tables in the 1931 *Annual Report of the Comptroller of the Currency* provide summary statistics by single years beginning in 1834 for (*a*) all reporting banks, (*b*) national banks (beginning in 1863), and (*c*) all reporting State and private banks (that is, nonnational banks). For nonnational bank data prior to 1873 the sources are as follows: For 1834–1840, Executive Document No. 111, 26th Congress, 2d session; for 1841–1850, Executive Document No. 68, 31st Congress, 1st session. For 1851–1863 (except 1852–1853), figures are from the report on the condition of banks for 1863. Those for 1853 are from Executive Document No. 66, 32d Congress, 2d session, and are incomplete. For 1852, the figures are estimates based on number of banks in 5 years, 1847–1851, and on assets and liabilities in 10 years, 1854–1863. For 1864–1872, all figures except number of banks and capital accounts are estimates based on data for the previous 10 years, 1854–1863.

Prior to 1896, figures shown here include all national banks and all State banks that voluntarily reported to State banking departments in the United States including mutual and stock savings banks, loan and trust companies, and private banks. A few banks in U.S. outlying areas are included. Data for nonnational banks for the earlier years are reported for dates other than June 30 and are known to be incomplete; many of the items have been estimated, as noted above. Where more reliable estimates prior to 1896 are available, they are included in alternate series X 678–682.

Beginning in 1896, more comprehensive data for nonnational banks than those included in the Comptroller's annual reports are available in *All-Bank Statistics, 1896–1955*, cited above. More detailed data than are shown here, by States and by class of banks, are available in this source, together with a description of the composition of the balance-sheet items, the methods by which the figures were compiled, and the classification of banks used.

Beginning in 1896, the figures include national banks and chartered or incorporated State banks, loan and trust companies, stock savings banks, and mutual savings banks. In conformity with the definition of a bank adopted in 1947, they also include unincorporated financial institutions which meet the definition of "bank"; cooperative exchanges in Arkansas which receive deposits; cash depositories in South Carolina; and Morris Plan and industrial banks (unless engaged merely in making loans and investments). In 1933 and 1934 only licensed banks, that is, those operating on an unrestricted basis, are included.

X 583, investments. For the national bank component, 1863–1865, total investments exclude securities other than those of the U.S. Government, which are included in "other assets" in the source. Total investments include all direct U.S. Government obligations and, since 1933, those fully guaranteed as to interest and principal by the U.S. Government; obligations of States and political subdivisions such as securities issued by States, counties, and municipalities, by school, irrigation, drainage, and reclamation districts, and by local housing authorities; and other securities, which comprise primarily obligations of domestic corporations, those of Government agencies not guaranteed by the United States, and foreign securities.

X 585, deposits. Total deposits for national banks for 1863–1865 include State banknotes in circulation and for 1866–1868, bills payable and rediscounts. Beginning 1942, deposit figures exclude reciprocal balances.

X 586, banknotes. Prior to 1864, figures represent State banknotes only; beginning 1896, national banknotes only. In 1865, a prohibitive tax was imposed on State banknotes and as a result only a few such notes were in circulation thereafter. Data for 1870–1910 exclude comparatively small amounts of State banknotes outstanding for which national banks, converted from State banks or merged with State banks, assumed liability.

X 587, capital accounts. Capital accounts include capital, surplus, net undivided profits, reserves for contingencies, and certain other reserve accounts. Capital is here used to designate primarily the original contribution of bank owners to the bank and is ordinarily evidenced by bank stock certificates. Surplus is ordinarily the amount of bank earnings specifically set aside as capital funds. Net undivided profits are earnings not yet set aside for dividends or allocated to surplus. In addition to reserves for contingencies, capital accounts include reserves for undeclared dividends and for accrued interest on capital notes and debentures as well as reserves for retirement of preferred stock or capital notes and debentures. Valuation reserves set up in connection with prospective but undetermined losses on loans, securities, and other assets *are not included* but are deducted from these assets. Prior to 1878, figures for nonnational banks include capital only; beginning 1933, the figures include preferred stock and capital notes and debentures.

X 588–619. General note.

The following quotation concerning the role of commercial banks in the economy is taken from Board of Governors of the Federal Reserve System, *Banking Studies,* 1941, p. 169:

> Commercial banks are part of the economic organization of the nation. They operate as business concerns and earn a living by rendering services to the public. By lending and investing money, they assist productive processes; by providing checking account services they facilitate and expedite the settlement of financial obligations. There are numerous other banking services, but most of them are related to the primary banking functions of making loans and investments and handling deposits. All these services and operations have to do with money, which may be viewed as the stock in trade of banks.

For further comment on commercial banks and the reason for their separate classification, see text for series X 683–688. See also text for series X 580–587 and general note for series X 561–820. The data presented in series X 588–619, prior to 1956, are for conterminous United States; thereafter, they include Alaska, Hawaii, and U.S. outlying areas.

X 588–609. All commercial banks—number of banks and principal assets and liabilities, 1896–1970.

Source: 1896–1955, see source for series X 580–587, pt. I, pp. 34–37; 1956–1970, see source for series X 580–587.

X 610–619. All commercial banks—number of banks and total assets, by Federal Reserve membership and class, 1896–1970.

Source: **Series X 610–611, X 612–615,** (1969–1970), and **X 616–617,** see source for series X 580–587; **series X 612–615,** (1956–1968), U.S. Federal Deposit Insurance Corporation, *Assets and Liabilities—Commercial and Mutual Savings Banks,* semiannual issues; **series X 612–613,** prior to 1956, Board of Governors of the Federal Reserve System, *Member Bank Call Report,* various issues (with adjustments to bring these data into conformity with the revised all-bank series); **series X 614–615,** prior to 1956, derived by deducting from the totals for all commercial banks (series X 588–589) the figures for all member banks (series X 610–613); **series X 618–619,** are all commercial banks (series X 588–589) less national banks (series X 634–635).

State member commercial banks are those banks chartered by the various States which have voluntarily requested membership in the Federal Reserve System and met the necessary requirements. Nonmember commercial banks are all other State-chartered banks (other than mutual savings banks). See general note for series X 561–820 and text for series X 580–587 and series X 683–688.

X 620–633. All banks—number of banks and total assets, by deposit insurance status and class, 1934–1970.

Source: 1934–1955, Board of Governors of the Federal Reserve System, unpublished data (compiled in connection with *All-Bank Statistics, United States, 1896–1955*); 1956–1970, U.S. Federal Deposit Insurance Corporation, *Annual Reports* and *Report of Call: Assets, Liabilities, and Capital Accounts—Commercial and Mutual Savings Banks,* June issues, and unpublished data.

See general note for series X 561–820 and text for series X 580–587.

The Federal Deposit Insurance Corporation was created in June 1933 to pay depositors of failed banks the amount of their insured deposits. All national banks and all other member banks of the Federal Reserve System are required by law to be members of the Federal Deposit Insurance Corporation. Banks that are not members of the Federal Reserve System may be admitted to Federal deposit insurance upon meeting certain prescribed conditions.

Detailed statistics on assets and liabilities and earnings, expenses, and dividends of insured banks by class are available in Federal Deposit Insurance Corporation, *Annual Report.*

X 634–655. National banks—number of banks and principal assets and liabilities, 1863–1970.

Source: See source for series X 580–587.

See also general note for series X 561–820.

National banks are those chartered by the Federal Government and are under the general supervision of the Comptroller of the Currency.

X 656–677. Nonnational banks—number of banks and principal assets and liabilities, 1863–1970.

Source: See source for series X 580–587.

Nonnational banks comprised all banks prior to 1863 (see general note for series X 561–820). These banks include State commercial banks, mutual and stock savings banks, private banks, loan and trust companies, and other institutions enumerated in the text for series X 580–587. For comment on incompleteness of nonnational bank data prior to 1896, see text for series X 580–587.

X 678–682. Nonnational banks—number of banks and selected assets and liabilities, alternate series, 1865–1896.

Source: **Series X 678–679,** David I. Fand, *Banks in the Post-Civil War Period in the United States, 1875–1896,* unpublished doctoral dissertation on file at University of Chicago. **Series X 680–682,** 1875–1882, U.S. Comptroller of the Currency, *Annual Report, 1885,* pp. clxix–clxxiii (discussion of figures, p. lxviii). **Series X 682,** 1865–1866, U.S. Federal Deposit Insurance Corporation, *Annual Report, 1934,* pp. 103, 112–113; 1867–1876, James K. Kindahl, *Estimates of Nonnational Bank Deposits for the United States, 1867–1875,* unpublished doctoral dissertation on file at University of Chicago, 1954, and Federal Deposit Insurance Corporation, *Annual Report, 1934,* pp. 112–113.

Data for all nonnational banks were compiled from tax returns submitted by banks during this period.

X 678–679, adjusted deposits and vault cash. Adjusted deposits as used here are total deposits (with original source figures adjusted

for nonreporting banks and for underreporting by banks) less cash items in process of collection. Data are as of August, 1875–1881, and June, 1882–1896. In the source volume, figures for nonnational commercial banks are shown separately from mutual savings banks.

Figures for capital accounts and total deposits (series X 681–682) are based on information included on semiannual tax returns and are monthly averages for 6 months ending May 31, 1876–1882, and for 6 months ending November 30, 1875.

The figures shown for total deposits (series X 682) for 1865–1876 are the sum of separate estimates for deposits of nonnational commercial banks and mutual savings banks. The methods of estimation are described in the sources cited above. The original source figures for commercial banks were adjusted for nonreporting banks but not for underreporting by banks.

X 683–688. Nonnational banks—number of banks and total assets, by class, 1875–1970.

Source: 1875–1896, U.S. Comptroller of the Currency, *Annual Report*, various issues; 1896–1955, see source for series X 580–587, pts. I and II; 1956–1970, see source for series X 580–587.

These series are a breakdown of number and total assets of nonnational banks shown in series X 656–657.

See also sources and text for series X 580–587.

State commercial banks are all banks other than national and mutual savings banks. The classification of banks as "commercial" is based on function or type of deposit business. Commercial banks include the holding of checking accounts and other deposits subject to withdrawal on demand, and the making of short-term self-liquidating loans to commerce, agriculture, and industry. Mutual savings banks, on the other hand, carry only savings and other time deposits (with some unimportant exceptions) and they invest their funds mostly in mortgage loans and securities. While the distinction between mutual savings and commercial banks is not strictly functional, since the great majority of commercial banks also carry varying proportions of savings and time deposits, it serves to segregate from banks holding demand deposits the group of banks that hold a large amount of deposits which represent principally savings. See series X 588–609 for balance-sheet data for all commercial banks, that is, national and State commercial banks combined.

Private banks are unincorporated institutions that operate ordinarily without a charter from either State or Federal Government. The number and relative importance of these banks has declined over the past half century.

The differences for 1896 in the data compiled by the Federal Reserve Board and by the Comptroller of the Currency indicate the incompleteness of early compilations of banking data, particularly in the case of private banks. Balance-sheet data are available in the Comptroller's annual reports for those banks submitting information to that agency. For separate figures for number and deposits of mutual savings banks, 1865–1896, see Federal Deposit Insurance Corporation, *Annual Report, 1934*, pp. 112–113.

In the source volume for 1896–1955, principal assets and liabilities are available separately for State commercial and mutual savings banks, by States, and for private banks in 18 States; in the remaining States, private banks were not segregated from other banks.

X 689–697. Savings and other time deposits, by type of institution, 1820–1970.

Source: **Series X 689**, sum of series X 690–694. **Series X 690–691**, National Bureau of Economic Research, unpublished data; see text for series X 418–419. **Series X 692**, U.S. National Credit Union Administration, *1970 Annual Report of the Administrator* and *1970 State-Chartered Credit Union Annual Report*. **Series X 693**, U.S. Post Office Department, *Annual Report of the Postmaster General, 1957* and *1969*. **Series X 694**, Board of Governors of the Federal Reserve System, 1892–1941, *Banking and Monetary Statistics*, pp. 34–35; 1942–1947, *Federal Reserve Bulletin*, January 1949, p. 41; 1948–1970, *Federal Reserve Bulletin*, September issues. **Series X 695–696**, U.S. Bureau of the Census, *Statistical Abstract of the United States, 1946*, p. 404. Data furnished by the American Bankers Association. **Series X 697**, U.S. Comptroller of the Currency, 1820–1896, *Annual Report, 1896*, vol. I, p. 720; 1897–1910, *Annual Report, 1920*, vol. I, p. 241.

See general note for series X 561–820.

X 690, mutual savings bank deposits. For definition of mutual savings banks, see text for series X 683–688. See also text for series X 821–833.

X 691, savings and loan association deposits. For definition of savings and loan associations, see text for series X 834–844. Mutually-owned associations accept deposits in the form of share capital; these are legally considered shares in the association and holders of shares are owners rather than creditors, as are depositors in banks. Other types of associations are those having some form of permanent stock ownership.

X 692, credit union deposits. A credit union is a cooperative nonprofit organization of individuals with a common bond of occupation, association, or residence. Its objectives are to promote thrift among its members and to provide them with a source of credit at reasonable rates of interest. Credit unions may be incorporated under Federal law or, currently (1970), under any of 44 State laws. Deposits include the purchase of shares, share certificates, or share deposit accounts in the credit union.

X 693, postal savings system deposits. The figures represent the balance to credit of depositors, including items shown on the balance sheets as unclaimed. They include both amounts redeposited in banks and amounts not so redeposited; they exclude amounts in banks in U.S. outlying areas. The Postal Savings System was discontinued as of April 27, 1966, and the accounts were eliminated after June 30, 1967.

X 694, commercial bank deposits. For definition of commercial banks, see general note for series X 561–820 and especially text for series X 588–609 and X 683–688. Deposit figures have been adjusted to exclude interbank deposits, which do not represent money available to the public, and items in process of collection, inclusion of which would represent a double counting of deposits. They exclude U.S. Treasurer's time deposits, open account, beginning 1939, and postal savings redeposited in banks. Beginning 1941, they exclude 3 member mutual savings banks.

X 695–696, national bank and State bank deposits. These data were originally furnished by the American Bankers Association, which discontinued this series after 1942. Savings and other time deposits include deposits evidenced by savings passbooks, time certificates of deposit payable in 30 days or over, time deposits (open account), postal savings redeposited in banks, and for some States, Christmas savings and similar accounts.

Series X 696 includes commercial, stock savings, and private banks and trust companies. Data shown for some of the years for these banks are incomplete for some States or have been estimated for others. Figures exclude 6 States in 1926 and 1927, 4 in 1928–1930, 3 in 1931, 2 in 1932 and 1933, and 1 in 1934–1937.

X 697, savings bank deposits. Data cover mutual and stock savings banks only.

X 698–715. General note.

Deposits in commercial banks are the major portion of the current means of payment. The extent to which such deposits are used is measured by statistics of bank debits. In conjunction with deposit figures, debits figures are a means of determining the rate of turnover of deposits in commercial banks. While these two measurements throw light upon current economic developments, the data must be used with care to measure changes in business conditions. Since factors not related to business activity may affect debits and deposits, these data reflect changes in general business conditions only in a broad way.

X 698–705. Bank debits and deposit turnover, 1943–1970.

Source: Board of Governors of the Federal Reserve System. 1943–1964, *Supplement to Banking and Monetary Statistics*, Section 5, "Bank Debits"; 1964 (revised)–1970, *Federal Reserve Bulletin*, (monthly data; annual averages from Federal Reserve Board).

Beginning with March 1953, the Board of Governors of the Federal Reserve System has published revised monthly bank debits series comprising only debits to demand deposit accounts of individuals, partnerships, and corporations, and of States and political subdivisions. Series X 698–701, which classify reporting centers into 3 groups—New York City, 6 other leading centers, and 338 other centers—provide a better measure of the activity of checking accounts than the discontinued series presented in X 706–709, which include debits to deposit accounts of the U.S. Government and to time deposits.

The turnover of demand deposits, series X 702–705, computed by dividing debits during a period (and converted to an annual rate) by average deposits against which the debits are made, indicates the number of times a deposit dollar is used during the period.

Monthly data on debits and annual turnover for the period beginning in 1943 are available in the *Federal Reserve Bulletin*, including a seasonally adjusted series for turnover.

X 706–709. Bank debits to deposit accounts, except interbank accounts, at reporting centers, 1919–1952.

Source: Board of Governors of the Federal Reserve System, 1919–1941, *Banking and Monetary Statistics*, pp. 234–237; 1942–1952, *Federal Reserve Bulletin*, June 1946, p. 630; June 1951, p. 665; and June 1953, p. 612.

Data for individual reporting centers, by months, for 1919–1941, are available in *Banking and Monetary Statistics*; for 1942–1952, they are available upon request from the Board of Governors of the Federal Reserve System.

Figures represent debits or charges on books of reporting member and nonmember commercial banks to deposit accounts of individuals, partnerships, and corporations, the U.S. Government, and State, county, and municipal governments, including debits to time and savings accounts, payments from trust funds on deposit in the banking department, and payments of certificates of deposit. Debits to accounts of other banks or in settlement of clearinghouse balances, payment of certified and officers' checks, charges to expense and miscellaneous accounts, corrections, and similar charges are not included. For a more detailed description of the data, see *Banking and Monetary Statistics*, pp. 230–233, and George Garvy, *Development of Bank Debits and Clearings and Their Use in Economic Analysis*, published in 1952 by the Board of Governors of the Federal Reserve System, especially chap. III, pp. 27–48.

Satisfactory figures are available for New York City and 140 other reporting centers, but the number of other reporting centers, and consequently the total number of all reporting centers, increased substantially for 1919–1952. (For details, see *Banking and Monetary Statistics*, p. 231, and *Federal Reserve Bulletin*, May 1952, p. 514.)

For revised data back to 1943, see series X 698–705.

X 710–715. Bank debits and deposit turnover, all commercial banks, 1919–1941.

Source: See first source cited for series X 706–709, p. 254.

For definition of debits, see text for series X 706–709; for definition of deposit turnover, see text for series X 698–705. Figures shown here are in part estimated; for a description of these series, see source, p. 232.

X 716–724. Number of banking offices, by deposit insurance status, 1900–1970.

Source: 1900–1941, Board of Governors of the Federal Reserve System, *Monetary Policy and the Management of the Public Debt*, Joint Committee on the Economic Report, 82d Congress, 2d session, pt. I, p. 553; 1942–1970, U.S. Federal Deposit Insurance Corporation, *Annual Report*, various issues.

Additional statistics on the number of banking offices are included in Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin* and *Annual Report*, and in Federal Deposit Insurance Corporation, *Annual Report*. The figures for 1900–1932 comprise national and all State-chartered banks except (*a*) mutual savings banks (data for which are not available until 1933) and (*b*) unincorporated or private banks not reporting to State banking authorities, other than certain large private banks which began to report to State banking authorities in 1934 and for which data are extended back to 1928. Separate data for State member banks are not available until 1933 (see text for series X 731–740). Beginning in 1942, the figures include banking facilities at military and other Government establishments; see series X 740. See also text for series X 580–587, X 620–633, and X 731–740.

X 725–730. Bank deposits insured by the Federal Deposit Insurance Corporation and the Deposit Insurance Fund, 1934–1970.

Source: U.S. Federal Deposit Insurance Corporation, *1970 Annual Report*, table 14.

See text for series X 620–633.

The Federal Deposit Insurance Corporation insured deposits in each account up to a maximum of $5,000 from 1934 to September 1950; to $10,000 from September 1950 to October 1966; to $15,000 from October 1966 to December 1969; and to $20,000 since then through 1970.

X 731–740. Branch banking, 1900–1970.

Source: Board of Governors of the Federal Reserve System. Number of banks and loans and investments or deposits, 1900–1941, *Banking and Monetary Statistics*, pp. 297, 311 (for data on private and mutual savings banks, see also annual tables in the *Federal Reserve Bulletin*); number of branches, 1900–1951, *Monetary Policy and the Management of the Public Debt*, Joint Committee on the Economic Report, 82d Congress, 2d session, pt. I, p. 555; all series for all other years, *Federal Reserve Bulletin*, April, May, June, or July issues.

The figures for number of branches represent some revisions of data previously published in *Banking and Monetary Statistics*. Detailed statistics on branch banking by States, by class of bank, and by location of branches relative to the head office, for selected years since 1900, are available in the sources indicated.

Branch banking is defined as a type of multiple-office banking under which a bank as a single legal entity operates more than one banking office. If a bank operates a single branch office, irrespective of size or functions, other than a "facility" as defined below, it is included here.

The statistics on branches include all branches or additional offices in conterminous U.S. prior to 1959, and include Alaska and Hawaii thereafter, within the meaning of section 5155, United States Revised Statutes, which defines a branch as "any branch bank, branch office, branch agency, additional office, or any branch place of business . . . at which deposits are received, or checks paid, or money lent." Branch figures, however, do not include banking facilities at military and other Government establishments, which began in 1942 through arrangements made by the Treasury Department with banks designated as depositaries and financial agents of the Government. The number of such facilities is shown separately in series X 740.

Branch banking is not to be confused with group and chain banking. Group and chain banking refers to types of multiple-office banking which differ from branch banking principally in legal form and type of control. For data on group and chain banking, see sources cited above.

For mutual savings banks, data are not available for banks operating branches and number of branches until 1933; deposits are available

only for the years indicated. Branches of unincorporated (private) banks not reporting to State banking authorities are not included prior to 1934. Separate data for State member and nonmember banks of the Federal Reserve System are available only for the years shown.

Wherever available, figures on loans and investments or deposits of banks operating branches are shown. These figures include the combined deposits or loans and investments of banks and their branches. For 1900–1936, the figures present loans and investments; for 1937–1941 and 1949, they are deposits, except as noted.

X 741–755. Bank suspensions—number and deposits of suspended banks, 1864–1970.

Source: **Series X 741,** sum of series X 742–745; **series X 748,** sum of series X 749–752. **Series X 742–754** (except X 745 and X 752 for 1864–1920), 1864–1891, U.S. Comptroller of the Currency, *Annual Report, 1931,* p. 1040; 1892–1933, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics,* pp. 283 and 292. **Series X 745** and **X 752,** 1864–1920, U.S. Federal Deposit Insurance Corporation, *Annual Report, 1934,* pp. 112–113; **series X 755,** 1921–1923, *Annual Report, 1940,* p. 66; **series X 742–747** and **X 749–755,** 1934–1970, unpublished data; **series X 741** and **X 748,** 1934–1970, *Annual Report, 1970.*

More detailed statistics for 1921–1941 are available in *Banking and Monetary Statistics,* including the number and deposits of suspended banks, by States and by class of bank, and in the *Federal Reserve Bulletin* for September 1937, pp. 866–910, and December 1937, pp. 1204–1224. The annual reports of the Comptroller of the Currency contain considerable material relating to national banks placed in receivership and losses sustained by depositors and stockholders of national banks.

Comprehensive and dependable statistics on bank suspensions are available only for comparatively recent years, that is, beginning with 1921. Prior to 1921, the figures are useful principally in showing the periods of abnormal banking mortality. Statistics for State banks prior to 1892 are fragmentary and incomplete. While figures for 1892–1920 are believed to be somewhat more reliable than for earlier years, they are not strictly comparable with the figures shown for 1921–1970.

Beginning with 1921, detailed data on the number and deposits of suspended banks were compiled from original reports on bank suspensions. The term "bank suspension" has been defined to comprise all banks closed to the public, either temporarily or permanently, by supervisory authorities or by the banks' boards of directors on account of financial difficulties, whether on a so-called moratorium basis or otherwise, unless the closing was under a special banking holiday declared by civil authorities. In the latter case, if the bank remained closed only during such holiday, it was not counted as a suspension. Banks which, without actually closing, merged with other banks or obtained agreements with depositors to waive or to defer withdrawal of a portion of their deposits likewise were not counted as suspended.

The figures for number of suspended banks for 1933 are not wholly comparable with those for other years. It was difficult in that year to determine the status of some banks because of the changes brought about by the State and national banking holidays and the subsequent reorganization of the banking system. The 1933 figures comprise banks suspended before the banking holiday, licensed banks suspended or placed on a restricted basis following the banking holiday, unlicensed banks placed in liquidation or receivership, and all other unlicensed banks which were not granted licenses to reopen by June 30, 1933. This date was selected because by that time supervisory authorities had completed their examination of practically all the banks not granted licenses immediately following the banking holiday, and had authorized the reopening of banks that could qualify for licenses. Since 1933, suspensions of insured banks have been handled by the Federal Deposit Insurance Corporation.

Deposits for suspended banks are as of the date of suspension for member banks of the Federal Reserve System and for nonmember banks, as of the date of suspension or latest available call date prior thereto, with the exception of unlicensed banks included for 1933. Deposits of unlicensed banks included in suspensions for 1933 are (*a*) for national banks, as of the date of conservatorship; (*b*) for State member banks, as of June 30, 1933, or the nearest call date prior to liquidation or receivership; and (*c*) for nonmember banks, the latest figures available at the time the banks were reported as having been placed in liquidation or receivership, or (for those which later reopened) as of the date license was granted to reopen.

Methods used in deriving the figures for losses borne by depositors (series X 755) for the periods 1865–1880, 1881–1909, and 1901–1920, are described in Federal Deposit Insurance Corporation, *Annual Report, 1940,* pp. 61–73.

There were no bank suspensions in Alaska and Hawaii.

X 756–767. Banks closed because of financial difficulties, 1934–1970.

Source: U.S. Federal Deposit Insurance Corporation, *Annual Report, 1970,* and unpublished data.

The Federal Deposit Insurance Corporation has used two procedures in fulfilling its responsibility to protect bank depositors from loss. It has paid depositors of insured banks placed in receivership up to the maximum limit prescribed by law and it has made loans to, or purchased assets of, financially distressed banks, thereby facilitating assumption of their deposits by another insured bank. The assumption of deposits by another bank enables business to continue with little or no deviation from normal routine, whereas a receivership may disrupt the economic life of the community.

Deposit figures at date of closing are adjusted to reflect subsequent corrections. In the case of banks placed in receivership, deposits at date of closing may be changed to include deposits discovered or reclassified after that date.

Data for losses to depositors in noninsured banks are not available.

There were no bank failures in Alaska and Hawaii.

X 768–791. General note.

The earliest available bank earnings data on a nationwide basis are those for national banks beginning in 1869. National banks were required to make earnings reports for the years 1869–1871 whenever dividends were declared; for 1872–1916, at least semiannually whether dividends were declared or not declared; for 1917–1961, for the periods ending in June and December; and for 1962 to the present (1970), annual reports for the calendar year. At first the report form included only cash dividends declared, net profits, and a few related items, but it became progressively more detailed and more comprehensive. Beginning with 1917, a breakdown as to the sources and disposition of earnings has been required.

X 768–775. National banks—earnings and expenses, 1869–1970.

Source: 1869–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics,* pp. 260–261; 1942–1970, U.S. Comptroller of the Currency, *Annual Report,* various issues.

Data are available for 1919–1941 for all Federal Reserve member banks (national and State member banks combined) in *Banking and Monetary Statistics,* pp. 262–265, and thereafter in various issues of the *Federal Reserve Bulletin.* For example, earnings and expenses are available by type; recoveries and profits, losses and charge-offs, and transfers to and from valuation reserves (beginning in 1948) are shown by character of asset. Data are also available for banks grouped by Federal Reserve District, State, class of bank, and size of bank. Various earnings ratios are available for part of the period.

The figures for gross and net current earnings before 1927 include profits on securities sold; such profits during the second half of 1926, when first reported separately, were $17,388,000. The figures for gross and net earnings up to and including the fiscal year ending June 1919 also include recoveries on charged-off assets; such recoveries

in the fiscal year ending June 30, 1919, were $21,066,000. Beginning in 1927 and 1919, respectively, these items are included in series X 772, which is the excess of total losses, charge-offs (including depreciation), and transfers to reserve accounts over total recoveries, profits, and transfers from reserve accounts, or vice versa.

Beginning 1969, data are not fully comparable with those for prior years: (1) net current earnings are reduced by a provision for loan losses; (2) X 770, expenses, includes only those income taxes applicable to current earnings; (3) the effect of taxes on other earnings is reflected in X 772; (4) X 772 is computed by summing securities gains or losses, extraordinary charges or credits, and the excess of transfers from reserves over transfers to reserves, all adjusted for tax effects.

X 776–791. Insured commercial banks—earnings and expenses, 1934–1970.

Source: U.S. Federal Deposit Insurance Corporation, 1934–1941, *Annual Report, 1941*, pp. 158–159 (except ratio of net profits to capital accounts which are from unpublished data); 1942–1970, *Annual Report*, various issues.

For a definition of commercial banks, see general note for series X 561–820 and especially text for series X 588–609 and X 683–688.

More detailed data than are shown here are available in the source. See description of additional data available for national and other Federal Reserve member banks in the text for series X 768–775.

Prior to 1969, reports of income and dividends were submitted to the Federal supervisory agencies on either a cash or an accrual basis. In 1969, banks with assets of $50 million or more, and beginning in 1970, $25 million or more, were required to report consolidated income accounts on an accrual basis. Smaller banks continue to have the option of submitting their reports on a cash or an accrual basis, except that unearned discount on installment loans, and income taxes, must be reported on an accrual basis. For national banks and for State banks in the District of Columbia, not members of the Federal Reserve System, the data are collected by the Comptroller of the Currency; for State bank members of the Federal Reserve System, by the Board of Governors of the Federal Reserve System; for other insured banks, by the Federal Deposit Insurance Corporation.

Earnings data are included for all insured banks operating at the end of the respective years, unless indicated otherwise. Beginning 1958, appropriate adjustments have been made for banks in operation during part of the year but not at the end of the year.

Series X 787 is the excess of total losses, charge-offs, and transfers to reserve accounts over total recoveries, profits, and transfers from reserve accounts, or vice versa. Beginning 1969, series X 787 represents the combination of "extraordinary changes or credits" and "net securities gains or losses."

X 792–795. Bank clearings at principal cities, 1854–1970.

Source: U.S. Comptroller of the Currency, 1854–1881, *Annual Report, 1920*, vol. 2, p. 849; 1882–1919, *Annual Report*, various issues. 1920–1962, *Commercial and Financial Chronicle*, New York, N.Y.; 1963–1970, Dun & Bradstreet, Inc., *Monthly Bank Clearings Report*, p. 2.

The first source cited above gives for New York the number of banks, capital, clearings, balances, average daily clearings, and average daily balances, for years ending September 30, 1854–1920.

For 1882–1919, figures are for all cities reporting to New York Clearing House Association and cover years ending September 30. Beginning 1920, all figures are for calendar years. For 1920–1935, series X 795 is for 146 identical cities. Beginning 1963, series X 793 is for 25 cities outside of New York City. The comparability of figures over the years is affected by (*a*) changes in the number of cities reporting and (*b*) the tendency toward consolidation of banks, eliminating former clearings between two or more banks. The source volume suggests that bank debits, series X 698–701 and X 706–709, are a better measure of volume of payment.

X 796–820. General note.

For purposes of administering the Federal Reserve System, the country is divided into 12 districts. There is a Federal Reserve bank in each district and most have one or more branches. Federal Reserve banks are organized as Federal corporations with capital stock subscribed by member banks in the respective districts. Member banks include all national banks and those State banks which have voluntarily requested membership and have met the requirements for joining the System. The number and total assets of national and State member banks are shown separately in series X 610–613 and for the two groups combined in series X 624–625.

The Federal Reserve banks are the principal medium through which the credit policies and general supervisory powers of the Federal Reserve authorities are carried out; they hold the legal reserves of member banks and perform for member banks many services related to those that commercial banks perform for the public, such as furnishing currency for circulation, facilitating the collection and clearance of checks, and providing discount facilities. The Reserve banks also act as fiscal agents, depositaries, and custodians for the U.S. Treasury and other Government units and perform numerous other important functions. The Federal Reserve banks are coordinated and supervised by the Board of Governors of the Federal Reserve System.

X 796–805. Federal Reserve banks—principal assets and liabilities, 1914–1970.

Source: Board of Governors of the Federal Reserve System. 1914–1941, *Banking and Monetary Statistics*, pp. 330–332; 1942–1959, *Annual Report*, various issues; 1960–1970, *Federal Reserve Bulletin*, January issues.

Complete and detailed balance sheets for all Federal Reserve banks combined and for each bank are included in the sources.

Since 1934, the reserves of the Federal Reserve banks have consisted principally of the gold certificate account, which is backed dollar for dollar by gold in the Treasury. The supply of these reserves is dependent primarily upon the size of the monetary gold stock, or more precisely upon that part of the gold stock against which the Treasury has issued gold certificates or gold certificate credits. For a discussion of changes in the items affecting the reserves of Federal Reserve banks, 1914–1934, see *Banking and Monetary Statistics*, p. 325.

Deposits of Federal Reserve banks consist mainly of reserves of member banks, shown in series X 803. They also include the checking account of the U.S. Treasurer, deposits of foreign banks and governments, and other accounts, such as accounts of certain nonmember banks maintained for use in clearing and collecting checks and checking accounts of Government agencies. For further description of the items included in this table, see *Banking and Monetary Statistics*, pp. 324–329, and *Federal Reserve System—Purposes and Functions*, chap. XIII, pp. 173–190.

For statistical series presenting Federal Reserve balance-sheet items and monetary data related to member bank reserves, see *Banking and Monetary Statistics*, pp. 360–401; *Federal Reserve System—Purposes and Functions*, chap. VIII, pp. 107–119; and the opening pages of the tabular section of *Federal Reserve Bulletin*, for example, March 1973, pp. A4–A8.

X 806–812. Federal Reserve banks—earnings and expenses, 1914–1970.

Source: Board of Governors of the Federal Reserve System. 1914–1962, *Annual Report*, various issues; 1963–1970, *Federal Reserve Bulletin*, February issues.

Federal Reserve banks are not operated for profit but they are self-supporting. The nature and the amount of Reserve bank earnings depend largely upon the demand for Reserve bank credit on the part of the member banks and upon Federal Reserve policy as to open-

market operations. Most of the expenses of the Reserve banks are incurred in collecting checks, supplying currency, and performing other services from which no earnings are derived.

Until 1933, the law required that the net earnings of the Federal Reserve banks, after deduction of the annual 6 percent cumulative dividend on paid-in capital stock, be allocated to surplus and to a franchise tax paid to the U.S. Government. In 1933, Congress abolished the franchise tax at a time when Reserve bank earnings were small and after Congress had directed the Reserve banks to contribute half of their surplus to the capital of the Federal Deposit Insurance Corporation. From 1947 to 1958, the Reserve banks paid to the Treasury nine-tenths of their net earnings after dividends and after adjustments to maintain their surplus accounts at the level of subscribed capital; in 1959, they began paying all of such earnings to the Treasury. Since 1964, surplus has been maintained at the level of paid-in capital (which is one-half subscribed capital).

X 813–820. Federal Reserve banks—member bank reserve requirements, 1917–1970.

Source: Board of Governors of the Federal Reserve System, *Annual Report* and *Federal Reserve Bulletin*, various issues.

Legal limits: These data represent reserve requirements authorized by law (the Federal Reserve Act, as amended). Since the September 21, 1966, amendment, requirements have been established by the Board of Governors of the Federal Reserve System between specific minimums and maximums set by the law. On December 31, 1970, these legal limits for ratios of demand deposits were 10 percent and 22 percent for member banks in reserve cities, 7 percent and 14 percent for member banks not in reserve cities. Ratios of time deposits were 3 percent and 10 percent for all banks.

The Federal Reserve Act as approved December 23, 1913, provided for temporary reserve requirements for member banks to be effective for a period of approximately three years. Amendment to the Act on June 21, 1917, established percentages below which reserve requirements might not be set, but fixed no upper limits. Maximum limits at twice the legal minimums were provided by the Act of August 23, 1935. From August 16, 1948, through June 30, 1949, maximum limits were increased to permit changes in reserve requirements for the purpose of preventing injurious credit expansion. After June 1949 the limits returned to their former levels. A 1959 Act changed the maximum reserve requirement on demand deposits of banks in central reserve cities and in reserve cities from twice the legal minimum to 22 percent. Another provision of that Act discontinued the central reserve city designation effective July 28, 1962, three years after passage of the Act. Maximums based on legal minimums for banks outside of reserve cities and for other classes of deposits at all banks were replaced temporarily in September 1966, and permanently in September 1968, by specific maximums and minimums.

Composition of reserves: The temporary reserve requirements in effect until 1917 authorized member banks to hold a part of their reserves as cash in their own vaults and a part on deposit with other banks. For a fuller discussion of these requirements and the 1917 amendment of the Federal Reserve Act, see *Federal Reserve Bulletin*, November 1938. Only balances with Federal Reserve banks could be counted as legal reserves from June 21, 1917, until late 1959. Since that time, member banks have also been allowed to count some portion of their vault cash as reserves. Effective December 1, 1959, vault cash in excess of 4 percent of net demand deposits could be counted by country banks. The percentage was decreased to 2½ on August 25, 1960. Central reserve city and reserve city banks were allowed to count vault cash in excess of 2 percent of net demand deposits effective December 3, 1959, and amounts above 1 percent beginning September 1, 1960. All member banks were allowed to count all vault cash as reserves effective November 24, 1960.

Net demand deposits are demand deposits subject to reserve requirements. In general, prior to 1917, net demand deposits were made up of (*a*) the gross amount of all demand deposits except those due to other banks, and (*b*) the net excess (if any) of demand deposits due to other banks over demand balances due from other banks and cash items in process of collection. From 1917 to August 23, 1935, the definition was substantially the same, except that U.S. Government deposits were exempt by law from all reserve requirements and were therefore excluded from net demand deposits. Beginning August 23, 1935, net demand deposits have been total demand deposits minus cash items in process of collection and demand balances due from domestic banks (also minus war loan and Series E bond accounts during the period April 13, 1943–June 30, 1947).

Reserve cities: Changes in the list of cities classified as "central reserve" and "reserve" for 1914–1960 are shown in the Supplement (1962) to Section 10 of *Banking and Monetary Statistics*. The central reserve city designation was terminated July 28, 1962. In 1962–1965, the reserve city designation was discontinued for five cities. Reserve cities on December 31, 1970, included the 36 cities where a Federal Reserve bank or branch is located plus the following: Columbus, Ohio; Des Moines, Iowa; Fort Worth, Texas; Indianapolis, Indiana; Miami, Florida; Milwaukee, Wisconsin; National Stock Yards, Illinois; St. Paul, Minnesota; Tulsa, Oklahoma; and Washington, D.C.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

* Denotes first year for which figures include Alaska and Hawaii.

[1] Total loans shown as net prior to 1969. See footnote 3.

[2] Includes circulating notes of both State and national banks. For State banknotes in circulation, chiefly for 1863–1872, see series X 675; for more complete figures for this series, 1860–1878, see series X 437. For national banknotes in circulation, 1864–1935, see series X 653.

[3] In 1969 and 1970, loans and securities are stated on a gross basis in total assets of commercial banks. Total reserves on loans and securities of commercial banks are included in total liabilities.

[4] Excludes one national bank in Alaska.

[5] Comparable with later data.

[6] See series X 679–682 for supplementary figures for nonnational banks: Vault cash, 1875–1896; deposits, 1865–1896; capital accounts, 1875–1882.

[7] Comparable with earlier data. See series X 656 for number of nonnational banks, 1875–1882.

[8] Number of nonnational banks estimated.

[9] For nonnational banks, all figures except number of banks and capital accounts are estimated; see series X 656–677.

[10] Incomplete.

[11] Estimates based on previous 5 years for number of banks and on 10 years, 1854–1863, for assets and liabilities.

Series X 588–609. All Commercial Banks—Number of Banks and Principal Assets and Liabilities: 1896 to 1970

[In millions of dollars, except number of banks. As of June 30 or nearest available date]

Year	Number of banks	Total assets or liabilities	Assets

* Denotes first year for which figures include Alaska and Hawaii.

[1] Beginning 1948, figures for loan items are shown gross (i.e. before deduction of valuation reserves); they do not add to the totals in 1948–1968 and are not entirely comparable with prior figures. Total loans were shown as net prior to 1969.

[2] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks. Total reserves on loans and securities of commercial banks are included in "other liabilities."

[3] Figures for member commercial banks exclude, and figures for noninsured nonmember commercial banks include, 1 member nondeposit trust company which is not insured by the Federal Deposit Insurance Corporation.

[4] Includes reserves.

[5] Beginning 1966, excludes corporate stocks, other than Federal Reserve bank stock, of national banks; reported with "other assets."

[6] Beginning 1966, includes domestic interbank deposits only. For 1961–1965, includes domestic interbank and postal savings deposits. Prior to 1966, includes deposits of foreign banks.

Series X 610–619. All Commercial Banks—Number of Banks and Total Assets, by Federal Reserve Membership and Class: 1896 to 1970

* Denotes first year for which figures include Alaska and Hawaii.

[1] For the period June 1941 through June 1962, member banks include mutual savings banks as follows: 3 before Jan. 1960, 2 through Dec. 1960, and 1 through June 1962; and in 1955–1970, they include 1 nondeposit trust company which is not insured by the Federal Deposit Insurance Corporation. [2] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks.

Series X 620–633. All Banks—Number of Banks and Total Assets, by Deposit Insurance Status and Class: 1934 to 1970

[As of June 30 or nearest available date. Includes data for U.S. outlying areas]

[1] Comparability of figures for classes of banks is affected somewhat by changes in Federal Reserve System membership, deposit insurance status, and reserve classifications of cities and individual banks, and by mergers, etc.

[2] Member commercial banks exclude, and mutual savings banks include, mutual savings banks which are members of the Federal Reserve System as follows: 3 from 1941 through 1959, 2 in 1960, and 1 in 1961–1970.

[3] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks. Total loans were shown as net prior to 1969.

[4] Figures for member commercial banks exclude, and figures for noninsured nonmember commercial banks include, 1 member nondeposit trust company which is not insured by the Federal Deposit Insurance Corporation.

Series X 634–655. National Banks—Number of Banks and Principal Assets and Liabilities: 1863 to 1970

* Denotes first year for which figures include Alaska and Hawaii.

[1] Beginning in 1948, figures for loan items are shown gross (i.e. before deduction of valuation reserves); they do not add to the total in 1948–1968 and are not entirely comparable with prior figures. Total loans were shown as net prior to 1969.

[2] Before 1903, includes securities borrowed.

[3] Beginning 1966, other investments exclude corporate stocks, other than Federal Reserve bank stock, of national banks; reported with "other assets."

[4] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks. Total reserves on loans and securities of commercial banks are included in "other liabilities."

[5] Excludes one national bank in Alaska.

[6] Comparable with later data.

[7] Beginning 1966, includes domestic interbank deposits only; for 1961–1965, includes domestic interbank and postal savings deposits. Prior to 1966, includes deposits of foreign banks.

[8] Comparable with earlier data.

[9] U.S. Government securities only.

[10] Includes State banknotes outstanding.

Series X 656–677. Nonnational Banks—Number of Banks and Principal Assets and Liabilities: 1863 to 1970

[In millions of dollars, except number of banks. As of June 30 or nearest available date]

								1863	494	239	405

– Represents zero.
* Denotes first year for which figures include Alaska and Hawaii.
Z Less than $500,000.
[1] Beginning in 1948, figures for loan items are shown gross (i.e. before deduction of valuation reserves); they do not add to the totals in 1948–1968 and are not entirely comparable with prior figures. Total loans were shown as net prior to 1969.
[2] Beginning 1966, excludes corporate stocks, other than Federal Reserve bank stock, of national banks; reported with "other assets."
[3] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks. Total reserves on loans and securities of commercial banks are included in "other liabilities."
[4] Comparable with later data.
[5] Beginning 1966, includes domestic interbank deposits only; for 1961–1965, includes domestic interbank and postal savings deposits. Prior to 1966, includes deposits of foreign banks.
[6] See series X 678–682 for supplementary figures: Number of banks, 1875–1882; capital accounts, 1875–1882; vault cash, 1875–1896; deposits, 1865–1896.
[7] Comparable with earlier data.
[8] Revised from source publication.
[9] Estimated.
[10] All figures except number of banks and capital accounts are estimated, using as a basis the previous 10 years, 1854–1863, inclusive.
[11] For more complete estimates of State banknotes in circulation, 1800–1878, see series X 437.

Series X 678–682. Nonnational Banks—Number of Banks and Selected Assets and Liabilities, Alternate Series 1865 to 1896

[In millions of dollars, except number of banks]

* Denotes first year for which figures include Alaska and Hawaii.

[1] In 1969 and 1970, loans and securities are stated on a gross basis in "total assets" of commercial banks. Total loans were shown as net prior to 1969.

[2] Figures for 1896–1946 are for private banks in 18 States only; private banks were not segregated from other banks in the remaining States in this period. Figures may not be completely accurate; private banks not insured by FDIC are not required to report to any Federal bank supervisory agency.

[3] Includes mutual and stock savings banks, 1875–1896; thereafter, mutual savings banks only. See footnote 2 for series X 630–633.

[4] Comparable with later years.

[5] Comparable with earlier years.

[6] The total of series X 683 and X 687 and the total of series X 684 and X 688 differ from series X 656 and X 657, respectively. The latter are revised data published in the *Annual Report* of the Comptroller of the Currency, 1931, without breakdown by class of bank.

[7] Revised data for number of mutual savings banks, 781 in 1876 and 771 in 1875, are included in *Annual Report* of the Comptroller of the Currency, 1920, vol. 1, p. 241, but total assets for these banks are not available.

Series X 689–697. Savings and Other Time Deposits, by Type of Institution: 1820 to 1970

[In millions of dollars. As of June 30 except as noted]

[1] Beginning in May 1942, 60 new reporting centers (affecting series X 706 and X 709) and a number of banks in previously included reporting centers (affecting all series) were added to those centers and banks included for the years prior to 1942. The figures for the period 1942–1952 are therefore not strictly comparable with those for the earlier years. The extent of the change in coverage is reflected for 1942 by comparing the figures shown above with those derived on the old basis, as follows: Series X 706—607,071; series X 707—210,961; series X 708—342,430; series X 709—53,679. (See *Federal Reserve Bulletin*, Aug. 1943, p. 717.)

[2] The number of centers in this group varied considerably; see text.

[3] Excludes interbank deposits and collection items.

[4] Partly estimated for first 4 months.

[5] 11 months only; data for Mar. 1933 not available because of bank holiday.

* Denotes first year for which figures include Alaska and Hawaii.

[1] For 1925, 1926, and 1932–1970, figures are as of December; for earlier years they are as of different dates for banks and branches: For banks, 1927–1931 and 1923–1924, as of December; for 1915–1922, as of June; for branches, 1924 and 1927–1931, as of June; prior to 1924, not for any uniform month. Figures in this table prior to 1947 have not been revised to bring them into conformity with the revised all-bank data referred to in the general note for series X 561–820.

[2] Comparability of figures for classes of banks is affected somewhat by changes in Federal Reserve membership, deposit insurance status, and reserve classifications of cities and individual banks, and by mergers, etc.

[3] Federal deposit insurance is compulsory for member banks of the Federal Reserve System.

[4] None in Alaska and Hawaii.

[5] Member commercial banks exclude, and mutual savings banks include, mutual savings banks which are members of the Federal Reserve System as follows: 3, 1941–1959, 2 in 1960, and 1 in 1961–1970.

[6] In 1947, the series was revised. See footnote 6 to series X 731–740.

[7] Federal insurance of bank deposits did not become effective until Jan. 1, 1934, and the number of nonmember banking offices by insurance status is not available prior to 1935.

Series X 725–730. Bank Deposits Insured by the Federal Deposit Insurance Corporation and the Deposit Insurance Fund: 1934 to 1970

[As of December 31, except as noted. Includes Alaska, Hawaii, and outlying areas]

1900	119	5	114

* Denotes first year for which figures include Alaska and Hawaii.

[1] For years prior to 1924, figures are not for any uniform month. For 1925, 1926, 1932–1970, as of December; for 1924 and 1927–1931, as of June.

[2] Includes 1 national bank in the Virgin Islands, with 2 branches, which became a member of the Federal Reserve System in 1957.

[3] Federal deposit insurance is compulsory for member banks of the Federal Reserve System.

[4] Figures for 1900–1932 comprise State-chartered commercial banks operating branches and their branches and those unincorporated (private) banks operating branches and their branches reporting to State banking authorities. Beginning in 1934, the proportion of private banks reporting was larger than in prior years.

[5] Banking facilities are provided at military and other Government establishments through arrangements made by the Treasury Department with banks. Some of these facilities are operated by banks that have no other type of branch or additional office.

[6] State member bank figures include 1 noninsured trust company without deposits.

[7] In 1947, the series was revised to conform (except that it excludes U.S. outlying areas) to the number of banks in the uniform all-bank series inaugurated in 1947 by the Federal bank supervisory authorities. The revision resulted in a net addition of 115 banks and 9 branches.

[8] Loans and investments, 1900–1936, and deposits, 1937–1941 and 1949, of banks operating branches, except for mutual savings banks for 1935 which are deposits. For other years data are not available. Prior to 1949 commercial bank figures exclude a small amount of deposits of private banks, data for which are available for selected years only as follows: 1935, $46 million; 1939, $102 million; and 1941, $138 million.

– Represents zero. Z Less than $500,000.

[1] For 1864–1891, all series except mutual savings banks are for year ending June 30; for mutual savings banks the date is not specified in the source. For 1892–1920, for all banks other than private, figures are for calendar year; for private banks, figures vary in ending date of reporting year as follows: 1892, June 30; 1893 (14 months), Aug. 31; 1894–1899, Aug. 31; 1900–1919, June 30; and 1920 (18 months), Dec. 31. For 1921–1970, all series are for calendar years. Series X 741 is composite as to reporting period since it comprises the summation of series X 742–745.

[2] Excludes deposits for 7 noninsured banks, for which data were unavailable.

[3] Beginning 1934, based on estimates.

[4] In commercial banks only. Estimated losses to depositors in mutual savings banks were as follows: 1922, $213,000; 1928, $31,000; 1930, $6,530,000; 1931, $157,000; 1932, $4,738,000; 1933, $7,085,000. (See *Annual Report* of the Federal Deposit Insurance Corporation, 1934, p. 113).

[5] Excludes deposits for 1 foreign-owned bank closed in 1941 by order of the Federal Government, requiring disbursements by the Corporation.

[6] Excludes 1 noninsured bank placed in receivership in 1934 with no deposits at time of closing.

[7] Excludes deposits for two cases requiring disbursements by the Corporation: 1 bank in voluntary liquidation in 1937, 1 noninsured bank in 1938 with insured deposits at date of suspension, its insurance status having been terminated prior to suspension.

[8] Figures not wholly comparable with earlier years; see text.

[9] Figures not comparable with losses to depositors shown in footnote 4 because source data differ for these series.

[10] Prior to 1892, the figures shown include all State commercial banks; separate figures for private bank suspensions are not available.

– Represents zero.

[1] Includes the following banks not shown separately which reopened or had their deposits assumed by another insured bank without financial aid of the Federal Deposit Insurance Corporation: 1935, 1 bank with deposits of $85 thousand; 1937, 2 banks with deposits of $328 thousand; 1949, 1 bank with deposits of $1,190 thousand; 1953, 2 banks with deposits of $26,449 thousand; 1957, 1 bank with deposits of $10,084 thousand; and 1962, 1 bank with deposits of $3,011 thousand. (See *Annual Report* of Federal Deposit Insurance Corporation, *1941*, pp. 99 and 101; *1949*, p. 191; *1953*, p. 80; *1957*, p. 8; *1962*, p. 4).

[2] Banks placed in receivership with deposits paid, to insurance maximum, by Federal Deposit Insurance Corporation, adjusted to exclude: 1937, 1 bank in voluntary liquidation; 1938, 1 noninsured bank with insured deposits at date of suspension (insured status having been terminated prior to suspension); 1941, 1 foreign-owned bank closed by order of the Federal Government.

[3] Banks in financial difficulties with deposits assumed by other insured banks, with financial aid of Federal Deposit Insurance Corporation.

[4] Previously published data adjusted to add 4 cases in 1934; 1 in 1937; 1 in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and to exclude 1 case in 1935; and 1 case in 1938. Deposits not available for 1 bank in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and 1 in 1954. Excludes 1 bank placed in receivership in 1934, with no deposits at time of closing. Deposits are not available for 7 banks.

[5] Includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed. Beginning 1962, data are changes in amount of the cumulative losses during the year. Figure in parentheses represents net recoveries. Total losses (including estimated losses in active cases) at end of 1970 were $67,703.

[6] Tabulated by Federal Deposit Insurance Corporation from receivership records. Includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed.

[7] Excludes deposits for 1 foreign-owned bank closed in 1941 by order of the Federal Government, requiring disbursements by FDIC.

Series X 768–775. National Banks—Earnings and Expenses: 1869 to 1970

[In millions of dollars, except number of banks. Includes Alaska, Hawaii, and outlying areas]

[1] All data except number of banks are for calendar year, 1919–1970; year ending June 30, 1907–1918; and year ending Aug. 31, 1869–1906. Number of banks are as of end of period.

[2] Income taxes have been treated as an expense throughout. Beginning in 1943, these figures differ from those shown in the source volume, because income taxes in the source volume are shown separately from other expenses and as a deduction from net current earnings.

[3] Licensed banks, i.e., those operating on an unrestricted basis.

[4] 10 months only.

[5] Annual basis.

[6] 6 months only.

Series X 776–791. Insured Commercial Banks—Earnings and Expenses: 1934 to 1970

[In millions of dollars, except number of banks. Includes Alaska, Hawaii, and outlying areas]

[1] Beginning 1961, rentals from bank premises are excluded from "other" earnings and are netted against "other" expenses. [2] Beginning 1961, "other" expenses includes fees paid to directors and committees, formerly included with "salaries and wages." [3] Prior to 1942, taxes on net income have been included with other expenses. Taxes on net income for insured nonmember commercial banks for 1936–1941 are available separately in *Annual Reports* of the Federal Deposit Insurance Corporation.

[4] Prior to 1942, represents net current earnings after deduction of income taxes; thereafter, net current earnings before deduction of income taxes, and beginning 1969, net current earnings before deduction of income taxes and securities gains or losses. See footnote 3.

[5] Includes income on Federal funds sold. [6] Net amounts after applicable taxes. [7] Estimated taxes applicable to operating earnings.

[1] 1914–1959, includes industrial advances not shown separately.

[2] Includes Federal Reserve notes held by the U.S. Treasury or by a Federal Reserve bank other than the issuing bank.

[3] Includes securities loaned–fully secured by U.S. Government securities pledged with Federal Reserve banks.

[4] Includes guaranteed obligations which were not issued until late in 1933. Reserve banks were first authorized to purchase them in 1934. The only holdings of such securities prior to 1939 were $181,000 at the end of 1935, which were included in "other securities."

[5] Figures not comparable with later years in part because prior to June 21, 1917, member banks were not required to keep all of their legal reserves with the Reserve banks; also, for 1914–1916, deferred availability accounts, subsequently shown separately in the source, are included in total deposits.

[1] Current earnings less current expenses plus other additions and less other deductions.

[2] The Banking Act of 1933 eliminated the provision in the Federal Reserve Act requiring payments of a franchise tax. Beginning in 1947, payments represent interest on Federal Reserve notes; see text.

[3] Payments made pursuant to section 13b of the Federal Reserve Act, relating to loans and discounts for industrial purposes provided for by act of June 19, 1934.

[1] When two dates are shown, the first applies to the change at central reserve or reserve city banks and the second to the change at country banks.

[2] For definition of net demand deposits, see text.

[3] Beginning October 16, 1969, member banks were required to maintain reserves at 10 percent against balances above a specified base due from domestic offices to their foreign branches.

[4] Effective January 5, 1967, time deposits such as Christmas and vacation club accounts became subject to same requirements as savings deposits.

[5] Authority of the Board of Governors to classify or reclassify cities as central reserve cities was terminated effective July 28, 1962.

Chapter X

Nonbank Financial Institutions (Series X 821-878)

X 821–878. General note.

Financial institutions other than commercial banks perform a role in credit and capital markets by mobilizing the savings of individuals and channeling these funds among various types of investments. As a result, the flow of savings to these institutions and the allocation of these funds to various investments are important determinants of interest rates and prices of securities.

X 821–833. Assets and liabilities of mutual savings banks, 1896–1970.

Source: Board of Governors of the Federal Reserve System. 1896–1944, *All-Bank Statistics*, 1959, table A-4; 1945–1962, *Supplement to Banking & Monetary Statistics*, section 12, "Money Rates and Securities Markets," table 26; 1963–1970, *Federal Reserve Bulletin*, March 1973, p. A39.

Mutual savings banks are mutual thrift institutions chartered by individual States, primarily those in the northeastern part of the United States. They have no capital stock or stockholders. Incorporators provide initial guaranty and expense funds, and under stated conditions these funds may be returned to them out of subsequent earnings. Most deposits in mutual savings banks take the form of passbook savings. After expenses of operations are paid, all earnings are either distributed as interest to depositors or added to reserves (surplus).

Data for 1930 and earlier years are from the Board of Governors of the Federal Reserve System. For 1931–1945, figures were obtained by the National Association of Mutual Savings Banks from State banking departments and directly from some individual savings banks. Reporting procedures for State banking departments were not completely uniform in this period and differed in some respects from those prescribed by the Federal Deposit Insurance Corporation. Beginning 1946, the data were collected by the National Association directly from individual savings banks and generally conform to FDIC reporting procedures.

X 834–844. Selected assets and liabilities of savings and loan associations, 1900–1970.

Source: U.S. Savings and Loan League, *Savings and Loan Fact Book, 1967*, p. 70; *1971*, p. 79; and *1972*, pp. 95 and 97.

Savings and loan associations—also known as cooperative banks, building and loan associations, and savings associations—are thrift associations chartered by individual States or by the U.S. Government.

Figures were compiled from the following sources: 1900–1933, U.S. Savings and Loan League, Chicago, Ill.; for insured associations, 1934–1949, annual supervisory reports; 1950–1970, monthly supervisory reports; and for uninsured associations, 1932–1970, annual supervisory reports. Resources of associations in liquidation are not included.

X 845–849. Postal Savings System, 1911–1967.

Source: U.S. Post Office Department, *Annual Report of the Postmaster General, 1957* and *1969*, and unpublished data.

The Postal Savings System was discontinued April 27, 1966, and the accounts were eliminated after June 30, 1967.

X 850–863. Outstanding loans and loan insurance or guarantees of Federal and federally sponsored agencies, by economic sector served, 1917–1953.

Source: R. J. Saulnier, Harold G. Halcrow, and Neil H. Jacoby, *Federal Lending and Loan Insurance*, Princeton University Press, 1958, appendix A, pp. 365–380 (copyright).

These series are combinations of data shown separately in the source volume for Federal and federally sponsored agencies. That volume shows amount extended during the year as well as amount outstanding. The economic sectors shown here are the major sectors shown in the source volume and an "other" group which combines minor governmental units and miscellaneous sectors. The coverage and classification are described in the source, chapter I, pp. 3–27, the footnote on pp. 28–29, and footnotes of tables A1 to A8. The following paragraphs are adapted from that text.

Federally sponsored agencies include all those having a special financial or administrative connection with the Federal Government, whether or not Federal funds were currently invested in them. Thus, they include agencies that were in some respects private or cooperative in ownership and organization but that operated in part with Federal funds; and agencies that, although no longer using Treasury funds, were specially connected with some Federal agency through the latter's power to appoint policymaking officers and in some cases to review policy decisions.

The Federal agencies represented under the various categories of loans, insurance or guarantees, and stock purchases are summarized in the source in footnotes to the economic sector tables (pp. 365–380) and are shown in greater detail in the source tables covering individual agencies (pp. 381–418). For example, among agencies making direct loans to the business sector were the Export-Import Bank of Washington, the Departments of Army and Navy, the Public Works Administration, the War Finance Corporation, the Reconstruction Finance Corporation, and the Smaller War Plants Corporation. Federal Reserve bank loans and participations in loans of private financing institutions to business under section 13b of the Federal Reserve Act were also included. Guarantees of loans to the business sector included guarantees by the Veterans Administration and by Federal agencies under Regulation V of the Board of Governors of the Federal Reserve System, as well as deferred participation commitments of the Reconstruction Finance Corporation.

Credit programs not covered by the tabulation shown here include loans to foreign governments (except the Export-Import Bank), direct and guaranteed loans by the Commodity Credit Corporation, and loans to State governments. Loans of the Export-Import Bank of Washington which could not be fully separated from lending to foreign concerns and to domestic concerns engaged in foreign trade were included in the business sector.

Outstanding amounts relate to three basic categories of Federal credit activities.

X 850–855, direct loans. These include (*a*) the full amounts of loans extended by specified Federal and federally sponsored agencies; (*b*) the amounts disbursed to private lenders by Federal agencies in purchasing outstanding loans made under Federal insurance or guarantee; and (*c*) the amounts disbursed on loans made in participation with private lenders.

Loans exclude credit extended incident to some other activity, as when the U.S. Commercial Company gave open book credit during

World War II in connection with its sales of commodities, and also grant-in-aid programs. Loans made indirectly—as when the Federal intermediate credit banks discount paper for production credit associations, enabling the latter to make loans to farmers—are included, as well as loans going directly to the ultimate borrower; but there is no double counting that would result from interagency loans.

X 856–860, loan insurance or guarantees. Loan insurance covers the full amounts of loans extended by private lenders and insured by Federal agencies. Loan guarantees cover (*a*) the amounts federally guaranteed, ranging from 100 percent to seldom lower than 50 percent of a privately made loan; and (*b*) the amounts of the Federal shares authorized under deferred participations, where the Government was ready to take up an agreed percentage of a privately made loan. Thus, credit actually extended under participation agreements with private lenders is included under direct loans; but during the time when there was merely a commitment outstanding to take up all or some part of a loan at the option of the private lender, the amount of the obligation is included as a loan guarantee.

X 861–863, stock purchases. Such purchases are included if identifiable as primarily credit aid, and they covered the amount of Federal funds invested. Stock purchases represent purchases of, and loans on, preferred stocks of banks and insurance companies, and purchases of capital notes and debentures of banks, by the Reconstruction Finance Corporation; purchases of shares of savings and loan associations by the Home Owners' Loan Corporation and the Treasury Department; purchases of stock of agricultural cooperative associations by the Tennessee Valley Associated Cooperatives, Inc.; and purchases of Class A stock of production credit associations by the production credit corporations.

X 864–878. Federal and State-chartered credit unions—number, members, savings, loans, and total assets, 1925–1970.

Source: U.S. National Credit Union Administration, *1970 Annual Report of the National Credit Union Administration,* and the *1970 State-Chartered Credit Union Annual Report.*

Early data on operations of credit unions are available in U.S. Bureau of Labor Statistics, *Monthly Labor Review,* 1936–1953 (usually in the latter part of the year), and in BLS Bulletin Nos. 797, 850, 894, and 922.

Data for Federal credit unions, which were authorized by legislation enacted in 1934, represent all operating unions. Data on State-chartered credit unions have been furnished annually by State officials charged with the supervision of such credit unions, to the National Credit Union Administration (formerly Bureau of Federal Credit Unions) since 1951, and to the Bureau of Labor Statistics prior to 1951. Figures for State credit unions represent reporting unions which, in recent years, have included more than 99 percent of all active unions; prior to 1939, the proportion reporting was about 80 percent.

Loans of credit unions (series X 873–875) are principally short-term consumer loans, but they include some real estate mortgage loans and a small amount of business loans.

[1] Includes assets not shown separately.

[2] Net, after mortgage pledged shares, through 1957. Beginning 1958, includes shares pledged against mortgage loans.

[3] U.S. Government securities only through 1967. Beginning 1968 the total reflects liquid assets and other investment securities. Included are U.S. Government obligations, Federal agency securities, State and local government securities, time deposits at banks, and miscellaneous securities.

Series X 845–849. Postal Savings System: 1911 to 1967

[As of June 30, except as noted. Includes Alaska, Hawaii, Puerto Rico, and Virgin Islands]

Chapter X

Insurance (Series X 879-962)

X 879–917. General note.

There are three general sources of primary data about life insurance as a whole: The various State insurance departments through their reports of the life insurance companies operating within their jurisdictions; commercial publishers of life insurance company data; and the trade and other associations of the life insurance companies.

Probably the most widely used of the State insurance department reports are those published annually by the New York Insurance Department. For the approximate period 1860–1880 these reports, which give data on the companies domiciled in the State and the companies of other States authorized to transact business in the State, are most frequently made use of to exhibit the progress of life insurance. The data presented in these reports for this period represent a very high percentage of the total life insurance business. Other State reports often consulted by researchers are those of Massachusetts and Connecticut.

Of the commercial publications, the most frequently used to study the progress of life insurance as a whole is the *Spectator Insurance Year Book*, published annually since 1873 by the Spectator Company, Philadelphia. (For 1873–1937, the publication was known as *The Insurance Year Book*. There were separate "Life" volumes from 1923–1963 and "Property, casualty" volumes through 1960.)

A number of the trade and other associations in the life insurance business prepare industrywide statistics on different aspects of life insurance. The Institute of Life Insurance, New York, a public relations organization formed by the life insurance companies, compiles a number of such statistics and publishes these, as well as data from other associations and from commercial publishers, annually in the *Life Insurance Fact Book*. Two major sources of insurance statistics included in the Institute compilations are the American Life Insurance Association and the Life Insurance Agency Management Association.

To obtain a series of figures over a long period it is not necessary to consult each annual edition of the publications mentioned above. Many of the *New York Insurance Reports* (known also as the *Annual Report of the Superintendent of Insurance*) contain a chronology which gives some of the salient statistics over a long period (sometimes only for selected years). Prior to 1963, the annual *Spectator Insurance Year Book* often gave the aggregates for all available companies for the preceding 10 years and, for the early years of this publication, a summary of data was presented for the companies operating in New York State. Thereafter, the monthly *Spectator Magazine* presents data on life, property, accident, and health companies.

The most recent *Life Insurance Fact Book* will generally give most of the preceding statistics compiled, as well as historical statistics from other sources, as far back as 1890 for some series.

In addition to the *Life Insurance Fact Book*, there are two compilations of historical statistics which are often consulted: J. Owens Stalson, *Marketing Life Insurance, Its History in America*, Harvard University Press, Cambridge, 1942 (the appendixes give data on the number of companies, life insurance sales, life insurance in force, and income as well as many other items from earliest available figures to 1937); and Frederick L. Hoffman, "Fifty Years of American Life Insurance Progress," *Quarterly Publications of the American Statistical Association*, New Series, No. 95, vol. XII, Boston, 1911 (tables of salient statistics, 1860–1910). The statistics presented in these publications do not always agree with the figures given here because in some cases different sources have been used, and in some cases adjustments and corrections of the source material have been made by the Institute of Life Insurance.

Because it represents the exception rather than the rule, it may be of interest to note two instances in which data on life insurance were collected in the decennial census of the United States. *Statistics of the United States in 1860*, 1866, pp. 293–294, contains some statistics on the number of life insurance companies, the amount of life insurance, the number of persons insured, and the annual premium income for 1860. Data on the life insurance business are also shown in the *Report on Insurance Business in the United States at the Eleventh Census: 1890, Part 2, Life Insurance, 1895*. This report contains statistics on life insurance for the decade 1880–1890 for the companies in operation as of December 31, 1889. It does not, however, reflect the business in this decade of companies which ceased to do business before December 31, 1889.

The basic reporting form utilized by all three types of primary sources in preparing their statistics is the annual statement convention blank. This is the prescribed accounting statement which each company must submit to the insurance department of each State in which it is licensed to transact business, setting forth the company's balance sheet, income and disbursement accounts, policy exhibit, and many supporting schedules. The collecting agencies supplement the data from the annual statement form from time to time through mail questionnaires, mostly among the life insurance companies.

An understanding of the historical statistics of life insurance requires some knowledge of the annual statement convention blank—the accounting methods used in preparing the form and changes in the form and methods over the years—and some knowledge of the history of life insurance.

Uniformity in the annual statement convention blank required by the States has been achieved through the efforts of the National Association of Insurance Commissioners. This association is a national organization composed of the officials of the various States who have supervision of insurance affairs within their respective States. It was formed in 1871 (under the name of the National Convention of Insurance Commissioners) and adopted its first convention blank in 1874. This organization has also achieved a degree of uniformity in insurance legislation and departmental rulings among the different States.

The convention blank has undergone revisions from time to time. The most recent significant revision in the annual statement convention blank took place in the form used for reporting the operations for 1951. Where these changes have affected the statistics shown, they are discussed below in the text for the specific series. For a complete discussion of the annual statement form now in use, and a comparison with the superseded form, see E. C. Wightman, *Life Insurance Statements and Accounts*, Life Office Management Association, New York, 1952 and J. C. Noback, *Life Insurance Accounting*, Irwin, Homewood, Ill., 1969. For a detailed discussion of two of the earlier forms, see *Life Insurance Accounts*, 1935 and 1941, by Wightman.

There are many nonstatistical histories of life insurance. A few that may be consulted are: Charles K. Knight, *The History of Life Insurance in the United States to 1870*, unpublished thesis, University of Pennsylvania, 1920; *Marketing Life Insurance, Its History in America* (cited above); and *The Bible of Life Insurance*, George W. Wadsworth, 1932.

The data presented here cover only life insurance as it relates to the insurance companies which are usually referred to as the legal reserve life insurance companies. These are life insurance companies operating under insurance laws specifying the minimum basis for the reserves a company must maintain on its policies. Other types of

life insurance include fraternal life insurance which is provided by societies, lodges, and similar fellowship organizations; life insurance with assessment associations, mutual aid groups, and burial societies; life insurance available through savings banks in three States; and veterans life insurance (consisting of U.S. Government Life Insurance and National Service Life Insurance) issued by the Federal Government to members of the Armed Forces and veterans of World Wars I and II.

Though in very recent years the greatest part of all life insurance in force in the United States has been provided by the legal reserve life insurance companies, veterans insurance at its peaks during or immediately after the World Wars exceeded or nearly equaled the totals achieved by the life insurance companies. Fraternal and assessment life insurance combined for the period 1879–1928 was a significant proportion of the life insurance company total (actually exceeding it for a year or two in the 1890's and never amounting to less than 10 percent of the life insurance company total for the period stated).

For historical statistics of veterans, fraternal, and assessment life insurance, see Stalson, *Marketing Life Insurance*, cited above, pp. 806–808 and 816–819.

The data for legal reserve life insurance companies which are presented here are subject to three types of limitations: (*a*) Changes in the annual statement convention blank on which the companies report their operations; (*b*) incompleteness of the data in terms of the number of companies for which information is available; and (*c*) lack of uniformity among the companies in the allocation of certain items to the categories of the convention blank, changes in allocation, and changes made by the publishers of life insurance data in their reporting methods.

Changes in the annual statement blank over the years have been discussed previously. With regard to the completeness of the statistics available, it is extremely difficult to obtain data for any given period on the operations of *all* the life insurance companies operating in the United States. Theoretically, one should be able to compile complete statistics by consulting the insurance reports of each State and the District of Columbia, but in practice this is not feasible. State insurance reports began in the 1850's, but it was not until 1919 that all States (and the District of Columbia) were issuing reports. (A list of the first reports on insurance companies by State departments of insurance is given in Stalson, *Marketing Life Insurance*, cited above, pp. 775–776.) Therefore, until 1919, there is no way of obtaining data from State reports for companies which operated in only those States for which reports were not available. Subsequent to 1919, the difficulties in compiling complete statistics arise from the lack of uniformity in the various reports with regard to the selection of items to be presented and the basis of reporting, and from the failure of some States to issue reports on a regular annual basis.

The life insurance companies omitted from the sources utilized are very small in size relative to those for which data are available. Therefore, even when a fairly large number of these very small companies are omitted, they account for a very small percentage of the total business. For example, in 1970, according to the Institute of Life Insurance, the 1,390 companies for which life insurance in force data were available accounted for 99.96 percent of the total which would have been obtained from the 1,792 companies in existence at the end of 1970. This percentage is doubtlessly lower for the earlier years and for some of the other categories, but it is highly probable that even the oldest figures presented here represent 90 percent or more of the total for all companies. This is true both with regard to the figures taken from sources, such as the *Spectator Insurance Year Book*, which collect data from all available companies, and for the figures for about 1860–1880 which are taken from the reports of the New York Insurance Department. (For a discussion of the percentage of total business accounted for by the New York Insurance Department reports, see Hoffman, "Fifty Years of American Life Insurance Progress," cited above, pp. 11–13.)

The third limitation with regard to the data of legal reserve life insurance companies pertains to the lack of uniformity in allocation of certain items to the categories of the convention blank and changes in allocation. There are many instances where neither the categories of the annual statement convention blank nor the instructions for filing the blank are detailed enough to specify clearly how a certain transaction is to be allocated, so that the treatment becomes a matter of the company's judgment. Thus, for example, of two companies writing monthly debit insurance (a form of life insurance with some of the features of both ordinary and industrial insurance), one may classify it as ordinary and one as industrial. Moreover, a company may decide to change the classification of an item; for the example just cited, a company may transfer at some point its monthly debit business from the industrial to the ordinary classification. Such problems can arise in all the series presented. Even when an accounting procedure tends to become widespread, it is often adopted by different companies at different times.

A further problem arises from the fact that the sources which compile industrywide statistics must often combine the many categories of the annual statement convention blank into broader classifications. From time to time, the manner of combining the categories may be altered or the manner of treating special categories, which are sometimes found in a few companies' convention blank, may be changed.

Related to the problems of changes in the annual statement convention blank and variations in the allocation of items is the problem of changes in method of valuation of policy reserves and assets. The amount of policy reserves reported in a company's convention blank is determined by the types of policies issued, the length of time they have been in force, and the age at issue. The policy reserves are also affected by the mortality table used, the interest assumption, and the reserve basis specified by the various States as the minimum basis for valuation. The assets of a company, and hence its surplus, are also affected by the method of valuation of assets. The problems of changes in valuation of assets and reserves do not appear to be factors of major significance, however, with regard to long-term historical trends of these series.

The general procedure used in preparing these statistics was to examine the various sources and compare the series available as to bases of reporting, completeness of coverage, etc. In those cases where alternative series were available, the selection was determined by completeness of coverage in terms of the number of companies for which data were obtainable, and the basis of reporting most consistent with current practice, on two conditions: (*a*) That the series be available for a sufficiently long period to preserve the trend, and (*b*) that component items could be obtained on the same basis or level of coverage as the totals. An illustration might make this clear. For 1879–1887, total assets can be obtained for all the companies operating in New York State. For the same period, totals for a larger group of companies can be obtained from the 1888 *Spectator Insurance Year Book*. The distribution of assets, by type, however, is available only for the companies operating in New York State. Rather than estimate a distribution for the larger asset totals or report a distribution which would not add to the total shown, the New York State figures were used for the total and for the distribution by type. For the period under discussion, the assets of companies operating in New York State represented from 92 to 97 percent of the assets given by the *Spectator Insurance Year Book* for all available companies.

In most cases, the various sources were identical with regard to bases of reporting and completeness of coverage. In these cases, the procedure was to compare the various sources presenting the same data for the same period. Thus for the early period, comparisons were made among the individual *New York Insurance Reports* and the summaries of these reports given in various issues of the *Spectator Insurance Year Book*, *Marketing Life Insurance*, and "Fifty Years of American Life Insurance Progress." For later years, comparisons were made among the various issues of the *Spectator Insurance Year Book* which covered the same period (mainly the 10-year aggregates

as compared with the aggregates given in each *Year Book*), *Marketing Life Insurance*, and the *Life Insurance Fact Book* (which utilizes a great deal of material from the *Spectator Insurance Year Book*).

Where the figures in the various sources were in agreement, the data presented were accepted unless some limitations were uncovered while making the comparisons. Where the sources were not in agreement, the reasons for the differences were investigated and the figures considered to be most accurate and complete were accepted.

Some of the figures presented here are original in the sense that they represent adjustments by the Institute of Life Insurance of existing figures for errors in addition, for omissions, or for changes in definition. Wherever possible, published material has been utilized.

X 879. Number of life insurance companies, 1759–1970.

Source: J. Owen Stalson, 1759–1936, *Marketing Life Insurance, Its History in America*, Harvard University Press, Cambridge, 1942, pp. 748–753. Institute of Life Insurance, 1937–1939, estimates; 1940–1970, *Life Insurance Fact Book, 1974*, p. 87, and unpublished data.

The figures comprise the total number of companies in operation at the end of the year and domiciled in the United States. This number is larger than the number of companies for which life insurance in force data are available (see general note for series X 879–917). For 1941–1949, figures do not include companies which started and then ceased operations within this period. For data on the number of companies formed, discontinued, and in operation, classified by stock and mutual for 1759–1937, see Stalson, cited above, pp. 748–753.

X 880–889. General note.

For 1854–1894, the series were derived by deducting from the insurance in force figures of U.S. life insurance companies the amount of their Canadian and other foreign business, and adding thereto the U.S. business of Canadian and other foreign companies. Data for 1895–1948 were derived from the totals of individual State estimates given in the "Life Insurance in Force by States" section of each *Spectator Insurance Year Book*.

For ordinary life insurance, the figures for 1815–1850 are for all available companies; for 1854–1877, the figures are for life insurance companies reporting to the New York Insurance Department. Beginning with 1878, the data are for all available companies. All the data for group, industrial, and credit life insurance are for all available companies.

Life insurance in force is the sum total of the face amounts (plus additions purchased with dividends) of the life insurance outstanding at a given time. The additional amount of life insurance payable under accidental death provisions (providing for payment of an additional death benefit in case of death as a result of accidental means, often called double indemnity) is not included.

Life insurance in force figures have been adjusted to represent insurance in force on the lives of residents of the United States whether issued by U.S. or foreign companies. For statistics of life insurance in force with U.S. life insurance companies, whether the policyholders are residents of the United States or of some other country, and for the number of policies outstanding, for 1900–1970, see *Life Insurance Fact Book, 1974*, pp. 25, 27, 30, 33, 35. Estimates by States are available from the "Life Insurance in Force by States" section of the annual *Spectator Insurance Year Book* and the *Life Insurance Fact Book*. For information on life insurance in force by plan of insurance, 1950, 1954, 1957, 1962, 1966, and 1970, see *The Tally of Life Insurance Statistics*, January 1959, pp. 1 and 2, March 1968, pp. 1 and 2, and November 1971, pp. 1 and 2.

For an alternative series of life insurance in force in the United States, for selected years, 1815–1937, see *Marketing Life Insurance*, cited above, pp. 816–817. The alternative series includes fraternal, assessment, and other types of life insurance, and is derived from aggregate figures of U.S., Canadian, and foreign companies, rather than as totals of State figures.

X 880. Number of life insurance policies in force in the United States, 1895–1970.

Source: Institute of Life Insurance, *Life Insurance Fact Book*, various issues.

Data represent all life insurance in force with U.S. life companies, including both direct business and reinsurance acquired. Data include group certificates and credit life insurance.

X 881. Coverage per family of life insurance in force in the United States, 1930–1970.

Source: See source for series X 880.

Families include the units defined by the Bureau of the Census as families, subfamilies, and unrelated individuals.

X 882. Total life insurance in force in the United States, 1815–1970.

Source: 1815–1850, see Stalson, cited above for series X 879, p. 787 (1850 estimate corrected for addition error); 1854–1899, a summation of series X 883 and X 885. 1900–1970, Institute of Life Insurance, *Life Insurance Fact Book, 1974*, p. 23, and unpublished data.

X 883. Ordinary life insurance in force in the United States, 1815–1970.

Source: 1815–1850, see Stalson, cited above for series X 879, p. 787. Institute of Life Insurance, 1854–1894, unpublished data; 1895–1970, *Life Insurance Fact Book, 1958*, p. 25, and *1974*, p. 23.

The 1854–1894 figures were compiled from the following sources, using the method described in the general note for series X 880–889: Ordinary insurance in force of U.S. companies: 1854–1858, Spectator Company, *Spectator Insurance Year Book*, 1878, p. 71; 1859–1877, Stalson, cited above for series X 879, p. 820; 1878–1894, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made). Ordinary business of U.S. companies in Canada: 1869–1894, Stalson, cited above for series X 879, pp. 833–834 (1873 figure adjusted; 1885–1894, industrial business in Canada of U.S. companies subtracted to get ordinary business in Canada). Ordinary business of U.S. companies in foreign countries other than Canada: 1868–1885, Stalson, cited above for series X 879, p. 824; 1886–1888, Hoffman, "Fifty Years of American Life Insurance Progress," cited above in general note for series X 879–962, p. 86; 1889–1894, *Spectator Insurance Year Book*, 1899, p. 466. Ordinary business of Canadian companies in the U.S.: 1889–1894, Stalson, cited above for series X 879, p. 839. Ordinary business of other foreign companies in the U.S.: 1854–1870, series for U.S. branches of British companies estimated by the Institute of Life Insurance; 1871–1881, 1885–1886, State of New York Insurance Department, *New York Insurance Report*, various issues; 1882–1884, data not available, but probably insignificant.

Ordinary life insurance refers to life insurance usually issued in amounts of $1,000 or more, with premiums payable on an annual, semiannual, quarterly, or monthly basis.

X 884. Group life insurance in force in the United States, 1911–1970.

Source: Institute of Life Insurance, *Life Insurance Fact Book, 1958*, p. 27, and *1974*, p. 23.

Group life insurance is life insurance issued, usually without medical examination, on a group of persons under a master policy. It is usually issued to an employer for the benefit of employees. The individual members of the group hold certificates as evidence of their insurance.

X 885. Industrial life insurance in force in the United States, 1876–1970.

Source: 1876–1894, Institute of Life Insurance, unpublished data; 1895–1970, see source for series X 884, *1958*, p. 31 and *1974*, p. 23.

The 1876–1894 figures were compiled from the following sources, using the method described in the general note for series X 880–889: Industrial insurance in force of U.S. companies: 1876–1894, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made). Industrial business of U.S. companies in Canada: 1885–1894, *Spectator Insurance Year Book*, various issues. Canadian and other foreign companies have never written industrial life insurance in the United States, according to available information.

Industrial life insurance is life insurance issued in small amounts, usually not over $500. Premiums are payable on a weekly or monthly basis and are generally collected at the home by an agent of the company.

X 886. Credit life insurance in force in the United States, 1917–1970.

Source: See source for series X 884, *1958*, p. 33 and *1974*, p. 23.

Credit life insurance is term life insurance sold through a lender or lending agency to cover payment of a loan, installment purchase, or other obligation, in case of death. Lending agencies are defined to include agencies that sell merchandise on time and mortgage departments of life insurance companies, as well as banks, finance companies, and other institutions or agencies to or through which financial obligations are incurred. The data refer to insurance on loans of 10 years or less duration.

X 887–889. Average size policy in force in the United States, 1895–1970.

Source: Institute of Life Insurance, *Life Insurance Fact Book*, various issues, and unpublished data.

X 890–893. General note.

Figures represent U.S. life insurance companies' sales (including reinsurance acquired) in the United States and in other countries. Credit life insurance is excluded.

Life insurance sales represent the sum total of the face amount of life insurance sold in a given period (in this case, one year). The additional amount of life insurance payable under accidental death provisions is not included. For definitions of ordinary, group, and industrial, see text for series X 883–885.

X 890. Total sales of life insurance by U.S. life insurance companies, 1854–1970.

Source: 1854–1920, a summation of series X 891–893; 1921–1970, see source for series X 884, *1958*, p. 23 and *1974*, p. 16.

Total life insurance sales in the United States, representing all sales to residents of the United States, whether issued by U.S. or foreign companies, are available, beginning with 1940, from the source, p. 20. These series give number of policies and amount of insurance, by type.

X 891. Sales of ordinary life insurance by U.S. life insurance companies, 1854–1970.

Source: 1854–1910, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1911–1920, Institute of Life Insurance, unpublished data (based on data from summary table of Spectator Company, *Spectator Compendium of Official Life Insurance Reports* for each year); 1921–1970, see source for series X 884, *1958*, p. 23 and *1974*, p. 16.

The estimates for 1854–1877 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies. Beginning 1888, the data are on a paid-for basis; beginning 1893, they exclude revivals, increases, and dividend additions.

Monthly sales and annual sales by States since 1923 are available in Life Insurance Agency Management Association, *Monthly Sales Survey*, various issues. See also *Life Insurance Fact Book*, 1947–1972 editions. For regional data, from 1929–1956, see U.S. Office of Business Economics, *Business Statistics, 1957 Biennial Edition.*

X 892. Sales of group life insurance by U.S. life insurance companies, 1911–1970.

Source: 1911–1920, Institute of Life Insurance, unpublished data (1911–1918, estimated from a survey of companies writing group life insurance at that time; 1919–1920, compiled from Group Life Exhibit in Spectator Company, *Spectator Compendium of Official Life Insurance Reports*, various issues); 1921–1970, see source for series X 884, *1958*, p. 23 and *1972*, p. 21.

The group life insurance figures are on a paid-for basis. Figures for 1912–1918 may reflect increases in existing contracts to some extent. Beginning 1919, figures exclude revivals, increases, and dividend additions.

X 893. Sales of industrial life insurance by U.S. life insurance companies, 1873–1970.

Source: 1873–1910, Spectator Company, *Spectator Insurance Year Book*, various issues; 1911–1920, *Spectator Compendium of Official Life Insurance Reports*, various issues; 1921–1970, see source for series X 884, *1958*, p. 23 and *1972*, p. 21.

Beginning 1893, figures exclude revivals, increases, and dividend additions.

X 894–907. General note.

The data for 1854–1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

In general, before 1951, income and disbursement items were reported on a cash basis (in the accounting use of the term). Beginning 1951, income and disbursement items are reported on an accrual basis (reflecting earned income and incurred claims and expenses).

Before 1951, gross investment income (without deduction of investment expenses) was reported as income, and investment expenses were reported as disbursements (included with "Commissions, expenses, taxes, and other disbursements"). Beginning 1951, investment expenses are deducted from gross investment income and the resulting net figure is reported as income.

X 894–897. Income of U.S. life insurance companies, 1854–1970.

Source: 1854–1910, see first source for series X 893; 1911–1970, see source for series X 884, *1958*, p. 53, *1970*, p. 57, and *1971*, p. 58.

X 895, life insurance premiums. For 1911–1970, this series was obtained by subtracting from premium income as reported in the source, the annuity premium series (series X 896) described below. Since 1947, accident and health premiums have also been subtracted from premium income.

This series includes premiums for ordinary, group, and industrial life insurance, including disability and accidental death provisions. A premium is defined as the payment, or one of the regular periodical payments, a policyholder is required to make for an insurance policy.

X 896, annuity premiums. For 1911–1931, data were obtained by subtracting from the "consideration for annuities" figures given in the aggregates of the *Spectator Compendium* each year, the amount of supplementary contracts involving life contingencies. The series on supplementary contracts involving life contingencies was compiled by the Institute of Life Insurance from data in the *New York Insurance Reports* and the annual editions of Alfred M. Best Co., *Best's Life Insurance Reports*, New York. For 1932–1951, data were obtained directly by summing annuity income items from *Spectator Compendium* aggregates each year. For 1952–1955, data were obtained by summing group and individual annuity data given in Institute of Life Insurance, *The Tally of Life Insurance Statistics*,

August 1956, p. 1; for 1956, Institute of Life Insurance, unpublished data; for 1957, *Life Insurance Fact Book, 1958*, p. 54; for 1958–1964, *1965*, p. 57; for 1965–1970, *1971*, p. 58.

This category includes considerations for group and individual annuities. Before 1911, figures include considerations for supplementary contracts with life contingencies. An annuity is defined as a contract that provides an income for a specified period of time, such as a number of years or for life. A supplementary contract is an agreement by the company to retain the lump sum payable under an insurance policy and to make payments in accordance with the settlement option chosen.

X 897, investment and other income. For 1911–1970, figures include considerations for supplementary contracts both with and without life contingencies. Before 1911, figures include considerations for supplementary contracts without life contingencies.

X 898–907. Disbursements of U.S. life insurance companies, 1854–1970.

Source: 1854–1918, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1919–1951, *Spectator Compendium of Official Life Insurance Reports* for each year; 1952–1970, Institute of Life Insurance, unpublished data.

Annual additions to policy reserves are not included. These constitute the greatest portion of the difference between income and disbursements. For data on policy reserves, see series X 916.

Figures for life insurance benefit payments paid to residents of the United States, either by U.S. or foreign companies, may be obtained, for 1940–1957, from the *Life Insurance Fact Book, 1958*, p. 39 and for 1958–1970, from the *1971* edition, p. 43. Death benefit payments in the United States by type of insurance, number of policies, and by State may also be obtained from the annual editions of the *Life Insurance Fact Book*. Monthly benefit figures and quarterly death benefits by States may be obtained from the *Tally of Life Insurance Statistics* through December 1971; the monthly benefit survey was discontinued thereafter. A summary of monthly data for several years may be obtained from U.S. Bureau of Economic Analysis, *Business Statistics*, biennial editions.

X 901, matured endowment payments. This series is defined as the proceeds paid under a policy which provides that a definite sum of money be paid to the policyholder after a specified number of years if he is then living. If the policyholder dies during the endowment period, payment is made to a beneficiary (such proceeds are included as death benefits).

X 903, policy dividends. A policy dividend is defined as a refund of part of the premium on a participating life insurance policy. It is a share of the surplus earnings apportioned for distribution and reflects the difference between the premium charged and actual experience.

X 904, surrender values. A surrender value payment is the amount paid to policyholders upon surrender, for cash, of a policy before it becomes payable by death or maturity.

X 905, disability and accidental death benefits. Disability benefits are payments under a feature added to a life insurance policy, providing for waiver of premium and sometimes payment of monthly income if the insured becomes totally and permanently disabled. For definition of accidental death benefits, see general note for series X 880–889.

Disability provisions became general around 1910 and benefits under these were usually included with annuity payments until 1920. Accidental death benefit provisions became general around 1917 and benefits under these were usually included with death benefits until 1920.

X 906, commissions, expenses, taxes, and other disbursements. This series includes payments on supplementary contracts, with and without life contingencies, and payments of dividends which have been left on deposit.

X 907, dividends to stockholders. Dividends to stockholders were shown as a disbursement in the annual statement convention blank before 1951. For 1951–1970, dividends to stockholders have been shown as a deduction from surplus in the surplus account.

X 908–913. Assets of U.S. life insurance companies, 1854–1970.

Source: 1854–1889, see first source for series X 893; 1890–1970, see source for series X 884, *1958*, pp. 64–91 and *1971*, p. 68.

The data for 1854–1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

Assets are on an admitted asset value basis, which is the aggregate value of all the assets used for determination of a company's balance sheet in accord with principles adopted by the insurance departments of the various States. Until about 1909, stocks and bonds were reported at market value. Until 1906, this value was determined by each individual company and, since 1907, by the insurance commissioners. In 1909, New York State required amortization of amply secured bonds, and this soon became the general practice. Stocks and nonamortizable bonds are generally reported at market value. Assets include the assets, distributed by type, of the accident and health departments of life insurance companies.

Shares of Federal savings and loan associations are included with series X 910. Series X 912 includes real estate sold on contract but does not include real estate owned subject to redemption. Foreclosed liens subject to redemption are included in "mortgages" and not transferred to "real estate" until the redemption period is past.

X 914. Net rate of interest earned on assets of U.S. life insurance companies, 1872–1970.

Source: 1872–1909, see first source for series X 893; 1910–1914, Institute of Life Insurance, unpublished data; 1915–1970, see source for series X 884, *1958*, p. 59; *1970*, p. 64; and *1971*, p. 63.

The net rate of interest earned is the ratio of the investment income for the year to the mean assets decreased by one-half the investment income. For 1872–1909, the investment income is gross investment income—i.e., there was no deduction of investment expenses. For 1910–1939, the investment income is net of investment expenses (including direct investment taxes) and the Federal income taxes treated as investment expenses. Beginning 1940, the investment income is net of investment expenses (including direct investment taxes) and all Federal income taxes. For 1872–1950, the assets used in the formula are ledger assets; beginning 1951, the assets are invested assets (including cash) and interest due and accrued.

For a discussion of the level of interest earnings before 1872, see Lester W. Zartman, *The Investments of Life Insurance Companies*, Henry Holt Company, 1906.

X 915. Total liabilities of U.S. life insurance companies, 1859–1970.

Source: 1859–1917, see first source for series X 893; 1918–1951, see second source for series X 893; 1952–1970, Institute of Life Insurance, *Life Insurance Fact Book, 1953–1958*, and *1971* editions.

Data include operations of accident and health departments of life insurance companies. The 1918–1931 figures were compiled by subtracting from total liabilities as given, the amount shown as "amounts set apart." The 1932–1942 figures were compiled by subtracting from total liabilities as given, the amounts shown as "special, voluntary contingency, etc., reserves." The 1943–1951 figures are those shown as total liabilities. The 1952–1970 figures were compiled by adding all the reserve and obligation items shown, excluding only special surplus funds, unassigned surplus, and capital.

X 916. Policy reserves of U.S. life insurance companies, 1860–1970.

Source: 1860–1864, State of New York Insurance Department, *New York Insurance Report*, 1865, pp. clxxv–clxxix; 1865–1889, see first source for series X 893 (for certain years, adjustments were made

by Institute of Life Insurance); 1890–1970, see source for series X 884, *1958*, p. 61, *1970*, p. 57, and *1971*, p. 65.

This series includes life, annuity, supplementary contract, disability, and accidental death reserves and, beginning 1947, business of accident and health departments of life insurance companies.

Policy reserves are defined as the funds that an insurance company holds specifically for the fulfillment of its policy obligations. Reserves are so calculated that, together with future premiums and interest earnings, they will enable the company to pay all future claims.

X 917. Capital and surplus of U.S. life insurance companies, 1859–1970.

Source: 1859–1917 (except 1868, 1869, 1870, 1879, and 1881 which are from various *New York Insurance Reports*), see first source for series X 893; 1918–1951, see second source for series X 893; 1952–1970, Institute of Life Insurance, *Life Insurance Fact Book, 1953–1958*, and *1971* editions.

The 1919–1931 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "amounts set apart." The 1932–1950 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "special, voluntary, contingency, etc., reserves" (for 1932–1942, "special, voluntary, contingency, etc., reserves" are shown as "liabilities"; for 1943–1950, this item is shown separately). The 1951–1970 figures were compiled by adding the items "special surplus funds," "unassigned surplus," and "capital."

This series includes operations of accident and health departments of life insurance companies.

X 918–932. Assets, policyholders' surplus, and premiums written of the property–liability insurance business, 1931–1970.

Source: A.M. Best Company, Inc., Morristown, N.J., *Best's Aggregates and Averages, 1959*, p. 1, and *1971*, p. 1. (Copyright.)

The aggregates in these series represent the totals of the property-liability insurance business except that the mutual company aggregates do not include a very large number of small companies operated on the township or county plans or on the assessment basis. Life insurance companies writing accident and health business are excluded unless they maintained completely segregated departments and statistics so that the separate department figures could be developed.

Aggregates through 1944 are based on the reported statutory underwriting results, with some companies including Federal income taxes as an expense of operation and others excluding them. For 1942 and 1943, the statutory profit before Federal income was estimated at $115,000,000 for each year and at about $70,000,000 and $65,000,000, respectively, after Federal income taxes. For 1944, the corresponding figures were $100,000,000 and $60,000,000. Beginning 1945, underwriting experience is recorded before Federal income taxes and underwriting results are on a cash basis for reserves.

Prior to 1951, figures included only business written by casualty companies. Figures for all years include Credit, Livestock, and Miscellaneous Unsegregated and Reinsurance Unsegregated Lines.

X 923–927, policyholders' surplus. Represents the sum of paid-in capital, if any, and net reported surplus.

X 928–932, net premiums written. Represents retained premium income, direct or through reinsurance, less payments made for reinsurance ceded.

X 933–946. Underwriting experience for stock and mutual companies, by type of insurance, 1925–1970.

Source: See source for series X 918–932, *1955* issue, pp. 122–125 and 182–185; *1963* issue, pp. 141–144 and 209–212; and *1971* issue, pp. 139–142 and 208–211.

See text for series X 918–932.

X 934, premiums earned. Represents the adjustment of the net premiums written with the increase or decrease during the year in the liability for unearned premiums.

X 935, unearned premiums. Represents the estimated aggregate net amount, after deduction of reinsurance credits, which an insurance company would be obliged to tender to its policyholders as return premiums for the unexpired terms, should it wish to cancel every policy in force.

X 936 and **937**, ratios. As to losses, the ratio of losses and claim expenses incurred to premiums earned is used, but expenses incurred are ratioed to premiums written. When premium volume is increasing or decreasing, the combined loss and expense ratio thus calculated is a more accurate gauge of underwriting than the statutory figure.

X 938 and **939**, underwriting profit or loss. This item is the statutory figure taken from the annual statements of insurance companies and represents a comparison of losses and expenses incurred with premiums earned, adjusted with minor profit and loss items. This statutory figure does not include any adjustment for the estimated gain or loss in the equity in unearned premium liability.

X 947–956. Stock company resources and operating results, 1910–1970.

Source: See source for series X 918–932, *1959*, pp. 20 and 22, and *1971*, pp. 30 and 32.

See text for series X 918–932 and X 933–946.

X 954, investment profit or loss. This item is the statutory figure taken from the annual statements of insurance companies. From 1931 to 1934, arbitrary average values were used in valuing stocks owned by insurance companies; since 1934, market prices have been used for stocks but all bonds not in default have been listed at amortized values. This item, therefore, does not reflect actual market prices for all securities since December 31, 1931, although in most recent years the market prices of high-grade bonds have usually exceeded the amortized values at which they are carried in the statements.

X 957–962. Subscription or premium income and benefit expenditures of private health insurance organizations, 1948–1970.

Source: U.S. Social Security Administration, 1948, 1950, 1955, and 1960–1970, *Social Security Bulletin*, February 1973, tables 17 and 20; all other years, unpublished data.

Blue Cross and Blue Shield data were supplied by the Blue Cross Association and the National Association of Blue Shield plans from data reported to them by the individual plans. The data for insurance companies were compiled by the Health Insurance Association of America from its annual survey of the number of persons covered by insurance companies under group and individual policies. The data for independent health insurance plans are estimates of the Office of Research and Statistics, Social Security Administration, based on its annual survey of these plans.

Series X 879–889. Life Insurance Companies and Life Insurance in Force in the United States, by Type: 1759 to 1970

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than $50,000.
[1] Beginning 1947, includes data on operations of accident and health departments of U.S. life insurance companies, not shown separately; therefore components will not add to totals.
[2] Beginning 1951, investment income is net of investment expenses.
[3] Beginning 1951, accidental death benefits included with death benefits; figures for series X 456 are for disability benefits only. Accidental death benefits approximately $30 million in 1951.
[4] Beginning 1947, includes policy dividends paid by accident and health departments of U.S. life insurance companies.
[5] Matured endowments included with death benefits.
[6] Annuity premiums included with life insurance premiums.
[7] Matured endowments and annuity payments included with death benefits.

Chapter Y

Government

Elections and Politics (Series Y 1-271)

Y 1–26. Methods of electing presidential electors, 1788–1836.

Source: Charles O. Paullin, *Atlas of the Historical Geography of the United States*, Carnegie Institution of Washington and American Geographical Society of New York, 1932, p. 89 (courtesy of the Carnegie Institution).

The presidential electors of each State, now chosen by popular vote in all States, are selected, according to the Constitution, "in such manner as the legislature thereof may direct." The development of political party direction of the electoral college was not anticipated in the Constitution and, during the early years of the Republic, electors were chosen in the several States by a number of different devices. The principal methods were election by the State legislature itself, by State electors popularly chosen to elect presidential electors, and by direct popular vote for the electors. With few exceptions, presidential electors have been elected by popular vote since 1828. The Legislature of South Carolina, however, continued to elect presidential electors until 1860. Since the Civil War, legislatures have chosen electors only twice—in Florida in 1868 and in Colorado in 1876.

Y 27–78. Voter participation in presidential elections, by State, 1824–1968.

Source: Walter Dean Burnham, Dept. of Political Science, Massachusetts Institute of Technology, unpublished data. The explanatory notes which follow were prepared by Professor Burnham.

The United States, unlike some other countries, has never developed an automatic, governmentally-operated system for enrolling potential voters. The uniform practice since the earliest times has been that each of the States is the sole judge of the electoral procedures which it prescribes within its jurisdiction, subject only to constitutional amendments, congressional legislation enacted pursuant to such amendments or other portions of the Constitution, and Federal judicial decisions. All of these may limit or abolish the States' discretion in specified areas of legal procedure pertaining to elections; otherwise, the general rule stated here has continuously applied to the conduct of elections in the United States.[1]

As a result of this heterogeneity, it is not possible to achieve precise *statements* of the eligible electorate. The data in series Y 27–78 are *estimates*, and should be read throughout with that point in mind.

Every estimate of voting participation is, in effect, a ratio between a numerator and a denominator. Errors in estimates may occur because of errors in the numerator, the denominator, or both. Problems with the numerator include the following: (1) The reported vote cast may have been heavily inflated by fraudulent ballot-box stuffing, as for example in Plaquemines Parish, Louisiana, in 1844, or in Kansas City, Missouri, between 1934 and 1938; (2) the stated vote may be only a fraction of the real vote cast, either because of fradulent suppression of returns, other forms of pressure on the electorate, or failure of subdivisions to report within the legal time limit (the latter very frequently occurring in Texas); (3) more or less major compiling or reporting errors, without fraudulent intent, may exist, and clearly did in a number of cases in the nineteenth century; and (4) available returns may be significantly fragmentary because the original records were lost.

Problems with the denominator, i.e. the population base, relate primarily to its derivation. Information which has been compiled into the denominator falls into the following classifications: (1) Age cohorts; (2) sex by age for and following every point at which women were enfranchised by State law or by the Nineteenth Amendment; (3) race, which substantially means adding the Negro adult male population to the denominator base in 1868 (ten Southern States) or 1870; (4) citizenship status, reported separately as "male citizens" in 1870, and in more detail beginning with the 1900 census.

The following possible elements of a denominator have *not* been compiled, though they have entered into State legislation regulating eligibility to vote: (1) Literacy of the adult male/adult population; (2) taxpaying components of the adult male/adult population; (3) other components (for example, the total number registered) which define those legally entitled to vote at any given time. There are two reasons for such exclusions: Many of such devices were deliberately employed, particularly between 1890 and shortly after 1960, to violate the letter and the spirit of the Fifteenth Amendment; and they are extremely heterogeneous—for example, some States have registration reporting covering all jurisdictions, some do not, and the times for which such information is available are extremely diverse.

The four major components of the denominator, the estimated eligible population, alone can be developed more or less accurately for all States and time periods but even these have very significant problems. In general, the denominator estimates are much more precise from 1900 on than they are for years prior to that date. The reason for this lies in the changing nature of census reporting of critical components which enter the calculation.

Age cohorts. From 1870, the adult male/adult population is specifically enumerated so that the whole number of those 21 years old and over can be stated. This was not the practice earlier. Procedures followed here were to sum all white male age cohorts entirely above 21, and to add to that sum a fraction of any age cohort which bracketed that age, *i.e.*, which included both males above and below 21 years. The fraction was derived by a simple division of the relevant bracketed age grouping, and addition of the quotient to the sum already derived. For example: The 1820 census yields free white male age classifications of 16–25, 26–44, and 45 and over. For Maine in that year, the total number of free white males 26 and over was

[1] *Only the most salient* of such interventions are mentioned here, specifically as they apply to the composition of the potentially eligible electorate. They are:
The Reconstruction Act of March 2, 1867, which (with the Supplemental Act of March 23, 1867) required that the ten ex-Confederate States still without Federal representation eliminate all racial barriers to the suffrage as a precondition for readmission.
The Fifteenth Amendment to the Constitution (1870), which forbade either the States or the Federal Government to deny the right of citizens to vote "on account of race, color, or previous condition of servitude," and subsequent implementing legislation of 1870, 1871, and 1875. (See also *Guinn v. United States*, 238 U.S. 347 (1915), in which the Supreme Court struck down the "grandfather clause" as a patent attempt to evade the command of this Amendment.)
The Nineteenth Amendment to the Constitution (1920), which enfranchised women on the same constitutional terms as men.
The Supreme Court's invalidation of the white primary, and of the doctrine that political parties, being private associations, could exclude Negroes or any others they chose to exclude from their nominating processes. (*Smith v. Allwright*, 321 U.S. 649, (1944).)
The Twenty-third Amendment to the Constitution (1961), extending presidential suffrage to the District of Columbia.
The Twenty-fourth Amendment to the Constitution (1964), prohibiting the levying of a poll tax or any other tax as a prerequisite to voting in Federal elections. (See also the Supreme Court's extension of this prohibition to State and local elections as well, *Harper v. Virginia State Board of Elections*, 383 U.S. 663 (1966).)
The Civil Rights Act of 1965 suspending all literacy tests in Alabama, Alaska, Georgia, Louisiana, Mississippi, South Carolina, Virginia, 40 counties in North Carolina, and one county in Arizona, and establishing Federal registrars in the affected areas.
The Civil Rights Act of 1970, which continued suspension for another five years; extended it to all literacy tests; lowered the minimum voting age from 21 to 18 in all Federal and State elections; and lowered the minimum residence requirement for voting in presidential elections to a uniform 30 days.
The Twenty-sixth Amendment to the Constitution (1971) which formally reaffirmed the lowering of the voting age minimum from 21 to 18 years.

46,920. The total number falling in the 16–25 age classification was 28,530. There being ten years in that classification, symmetrically divided five (16–20) and five (21–25), figure of 28,530 was divided by two, yielding 14,265; this was, in turn, added to the sum of free white males 26 and over (46,920) to produce a total estimated electorate of 61,185. (The figure of 61,185 is too precise but serves to provide the basis from which such estimates could best be derived; the procedure for dividing bracketed age classifications in the census arbitrarily presupposes a linear or uniform age distribution among all the years in the grouping. State-by-State actuarial estimates for this period could easily permit a different procedure. The effect of the procedure used is, unquestionably, to inflate the denominator from its "true" value and thus to generate a lower turnout figure than was actually achieved in these years.)

The following table indicates the bracketed age cohorts and the criteria for division and compilation:

Age Cohorts in the United States Census, 1790–1860 [a]

Census	Bracketed age classification	Distribution of years		Divisor
		Below 21	21 and over	
1790 [b]	16 and over			[b]
1800	16–25	16–20	21–25	2
1810	16–25	16–20	21–25	2
1820	16–25	16–20	21–25	2
1830	20–29	20	21–29	10
1840	20–29	20	21–29	10
1850	20–29	20	21–29	10
1860	20–29	20	21–29	10

[a] *Throughout*, the basis is that of free white males. This excludes a small fraction of free Negroes who were at least nominally entitled to vote in several States. No estimate of citizenship exists except for 1860.

[b] The procedure for estimation in 1790 is a simple transfer from 1800 data: The proportion in each State of the *total* free white male population of age 16 and over which is estimated to be of age 21 and over.

Sex components. Women were universally enfranchised in 1920, but a number of States gave women suffrage earlier. In order of enfranchisement, the States which extended suffrage to women *before* 1920 were: Wyoming, as territory, 1869; Colorado, 1893; Utah, 1896; Idaho, 1897; Washington, 1911; California, 1911; Oregon, 1913; Arizona, 1913; Kansas, 1913; Montana, 1914; Nevada, 1914; Illinois, 1916, presidential only; Michigan, 1918; and New York, 1918. In all cases, appropriate sex-related adjustments were made in the denominator effective with the first election to which they applied.

Racial components. Negroes were enfranchised in ten Southern States effective with the 1868 election and nationally by the Fifteenth Amendment (1870). Prior to 1868, the proportion of free Negroes allowed to vote at all was extremely small; and the States in which they were allowed to vote had very small Negro populations. No effort, therefore, has been made to include a component for other than white races in the denominator prior to 1868/70. In Vermont, Maine, Massachusetts, and New York this means a tiny *deflation* of the denominator from its probable true value, and an equally small overestimation of the participation rates prior to 1870.

Citizenship components. This element represents the most difficult of the four major denominator components to estimate for the period prior to 1890–1900, for the following reasons: First, the 1928 election was the first presidential election in which American citizenship was a *universal* prerequisite for voting. In particular, the period from about 1840 through about 1910 was one in which a considerable number of States permitted aliens (those who had filed first papers, as a rule) to vote in elections. Every effort has been made here to identify by State and at what times these were legally qualified to vote. The denominator is thus grounded in part upon a legal definition which is heterogeneous across space and, for the States in which aliens were once allowed to vote, across time as well.

Second, the population census during most of the nineteenth century is not helpful in decomposing the foreign-born population, when reported, by citizenship status. Prior to 1870, no basis for estimation exists at all from the census materials. In 1870, males of 21 and over are reported in two columns, one of which specifies male *citizens*. Combining this with analysis of the size of the foreign-born component of the voting-age male population, certain probable inferences can be made about the proportion of foreign-born males of legal age who had been naturalized, and about these compared with later censuses for which specific proportions are reported. No help is given on this question in the 1880 census. The 1890 census (Population, part II, p. lxvi) gives a percentage breakdown by State of the foreign-born population by status: Naturalized, first papers, aliens, unknowns. From 1900 onward, census figures are provided for these categories in absolute numbers.

A period of particular difficulty in estimation lies between 1860 and 1890. Prior to 1860 no effort is made to decompose the denominator (population base) estimate by citizenship. For 1860 and the years interpolated to 1870, the same *proportion* of citizens over 21 to all males over 21 which the 1870 census employs is used to derive the estimated potential electorate of 1860. Where proportions exist for 1890 and 1870 and the State requires citizenship status of its voters through this period, the mean of the two proportions is used for estimating the 1880 proportion and thus the denominator. Where States permitted alien voting, an effort was made to estimate the proportion of naturalized and first-paper foreign-born to all foreign-born for 1870, based upon the mean of 1890 and 1900 proportions. No such refinements were made for 1860.

There is some reason to believe that these proportions were relatively stable, particularly in States where the frontier stage of settlement had passed. With the raw figures of the 1870 census and the percentage decomposition of foreign-born males of voting age in 1890, the general outlines of this stability can be seen in the example of Ohio. In 1870, citizen males constituted 92.4 percent of the total male population of voting age; in 1890, 93.7 percent; in 1900, 94.4 percent.[2] From this an interpolated estimate of 93.1 percent was derived for 1880, and the 1870 figure, 92.4 percent, was used to calculate the estimated eligible electorate of the 1860 voting-age male population.

Distribution of Ohio Male Population of Voting Age, 1890–1910

Year	Citizens			Aliens	Total males 21 and over
	Native white	Naturalized	Negro		
1890	76.0	15.1	2.6	6.3	1,016,464
1900	78.8	13.0	2.6	5.6	1,212,233
1910	76.5	9.6	2.7	11.2	1,484,265

States which permitted alien suffrage and subsequently abolished it are presented below, with the effective year of abolition so far as is known.

Alien-Suffrage States

State	Effective year of abolition	State	Effective year of abolition
Arkansas	1925	Nebraska	1910
Colorado	1902	North Dakota	1898–1902
Illinois	1870	Ohio	1851
Indiana	1921	Oregon	1914
Iowa	1857	South Dakota	1918
Michigan	1894	Wisconsin	1908
Minnesota	1896		

The problems of estimation are clearly more acute in the citizenship area than in any other. *The figures presented here are to be considered provisional and subject to revision*; no claim is made that the denominators and the participation estimates derived from them are the best

[2] In 1910, as the consequence of the influx of the "new immigration" after 1900, this figure falls to 88.8 percent, corresponding to a percentage decline of naturalized to all foreign-born from 70.3 percent in 1890, to 69.6 percent in 1900, and to only 46.2 percent in 1910.

possible estimates. Limited explorations suggest that the probable margin of error in turnout estimates—at least for States requiring citizenship qualifications—is well under 1 percent for the 1870–1900 period.

One final remark about method involves the ratio between numerator and denominator. In the absence of any better estimation, the biennial figures are compiled throughout on the basis of *linear interpolation* between one decennial census year and the next. Obviously, patterns of population growth and decline are never perfectly linear and may deviate widely from that assumption. This is particularly visible as a problem in the "mining-camp" States of the West, especially in Nevada before World War I. A metal lode was discovered at a point in time following a census. Voting-age males poured into the State until the lode was exhausted; and then they left. All of this produced extreme deviations of empirical population realities from any linear model, with resultant wild fluctuations in turnout. Fortunately, the linear model does not appear sharply inconsistent with reality in well-settled States. In any event, no known alternative to it appears to exist throughout most of American political and demographic history except in those few States which published adequate censuses falling between Federal census years.

Y 79–186. General note.

The election of the President of the United States is provided for in the Constitution, article II, section 1, through the establishment of an electoral college in each State, for each presidential election. The method of casting the electoral vote was modified in 1804 by the adoption of the 12th amendment to the Constitution. The number of electors, and therefore of electoral votes, is "equal to the whole number of Senators and Representatives to which the State may be entitled in Congress." Because of the varied practices in choosing electors in earlier years, the record of popular votes is inadequate to explain the elections until after 1824.

In four elections the entire electoral vote of certain States remained uncast: (a) 1789—no electoral vote was cast in New York because the legislature failed to agree on electors; (b) 1864—no vote in Confederate States (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North and South Carolina, Tennessee, Texas, and Virginia); (c) 1868—no vote in Mississippi, Texas, and Virginia because these States had not yet been "readmitted" to the Union; (d) 1872—the vote of Arkansas was rejected, the count of the popular vote in Louisiana was disputed, and the votes of both sets of electors were rejected by Congress.

Figures represent spending by all national level committees, but not by the candidates themselves. Figures for Republicans, 1912, and Republicans and Democrats, 1916–1944, include amounts transferred to the States as well. National-level committees proliferated after 1940, when the Hatch Act limitation of $3 million on the expenditures of a single committee and the $5,000 limitation on individual contributions went into effect.

For campaigns from 1860 to 1912, figures are estimates at best. For 1912 and later campaigns, figures are relatively reliable. Although the value of the dollar shrank and the voting population expanded more than fourfold from 1912 to 1952, the cost per vote was 19 cents in both of those campaigns. Between 1912 and 1952, however, the cost per vote fluctuated widely. By 1968, the cost per vote had increased to 60 cents.

[3] These include such States as Iowa, Michigan, Massachusetts, and above all, New York between 1845 and 1875. There is a mass of potentially useful and still unrecovered or unsused State material which should be employed for the nineteenth century. Such material includes lists of taxables triennially compiled from 1814 through 1828 in Pennsylvania (available in *Hazard's Register* (1825(1835)), and the Missouri State census of 1844, available only as an appendix to the *Missouri Senate Journal* (1845).

Some measure of the activities of the U.S. Congress can be gained from the number of bills and resolutions which have been introduced in Congress and from the number of public and private laws which have been passed. The abrupt reduction in the number of private bills enacted into law beginning with the 60th Congress was the result of combining many private bills, particularly pension bills, into omnibus enactments.

Y 199–203. Congressional bills vetoed, 1789–1970.

Source: U.S. Congress. Senate Library, *Presidential Vetoes*, U.S. Government Printing Office, 1969, p. v, and *Calendars of the U.S. House of Representatives and History of Legislation*, annual issues.

The term "veto," which does not appear in the Constitution, indicates the action of the President when he disapproves a bill and returns it with his objections to the House of Congress which originated the measure. These regular vetoes differ from pocket vetoes, which result when a bill fails to become law because the President has not signed it within 10 days but cannot return it with objections because the Congress has adjourned during the same period. For a bill to pass over a veto, both Houses of Congress must vote to override the veto.

Y 204–210. Political party affiliations in Congress and the Presidency, 1789–1970.

Source: 1st to 74th Congress, Library of Congress, Legislative Reference Service, "Political Trends—Both Houses of Congress—1789–1944" (typewritten tabulation based on *Encyclopedia Americana*, 1936 edition, vol. 7, pp. 516–518, 1st to 69th Congresses; and on Harold R. Bruce, *American Parties and Politics*, 3d edition, Henry Holt and Co., New York, 1936, pp. 174–179, 70th to 74th Congresses); 75th to 91st Congresses, U.S. Congress, *Congressional Directory*, annual volumes.

It is generally recognized today that popular government operates only through the agency of organized political parties. During the early development of the United States, party alignments and the function of political parties were neither fully appreciated nor provided for. Party alignments developed during the formative period, but designations for the different groups were not firmly fixed.

In the classification by party, the titles of parties during early years have been so designated as to be recognizable in the records of the periods concerned, and also to show the thread of continuity which tends to run from early alignments into the present 2-party system. Inasmuch as the party of Thomas Jefferson (generally known at the time as the Republican party) has with a considerable measure of continuity survived to the present time as the Democratic party, the name later accepted by the Jeffersonian Republicans of "Democratic-Republican" is used in the tables to avoid any confusion of the early Jeffersonian Republican with the present-day Republican party. Opposed to the early Republican party was the Federalist party, which was dominant in the first national administration and which, with interruptions, can be traced tenuously by elements of popular support through the National Republican, the Whig, and the Free Soil parties to the Republican party of today.

Y 211–214. Vote cast for Representatives, by political party, 1896–1970.

Ewing, *Congressional Elections, 1896–1944*, University of Oklahoma Press, Norman, 1947, and from unpublished work sheets used in its preparation and the biennial reports of the Clerk of the House of Representatives giving statistics of Congressional voting.) 1952–1962, U.S. Bureau of the Census, *Congressional District Data Book (Districts of the 88th Congress)*; 1964–1968, Governmental Affairs Institute, Washington, D.C., *America Votes 8*, 1970 (copyright); 1970, U.S. Congress, Clerk of the House, *Statistics of the Congressional Election*.

Y 215–271. General note.

The number of members in the House of Representatives is fixed by the Congress at the time of each apportionment. The population figures used for apportionment purposes are those determined for the States by each decennial census. No reapportionment was made following the 1920 census, and no change in total House membership has been made since 1912. However, the legislation granting statehood to Alaska and Hawaii allotted one Representative to each of those States and, during 1960 to 1962, increased the total of members to 437. The total reverted to 435 after reapportionment following the 1960 census. The original assignment of Representatives for each State, to be in effect until after the first enumeration of the population, and the requirement that each State have at least one Representative are stated in the Constitution.

Prior to the passage of the 14th amendment, Representatives were apportioned among the States "according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons." (Art. I. sec. 2.) In effect, censuses between 1790 and 1860 included three-fifths of slaves in the apportionment population. Since the passage of the 14th amendment in 1868, Representatives have been apportioned "among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." At the time of the 1940 apportionment, it was determined that there were no longer any Indians who would be classed as "not taxed" under apportionment law.

In 1970, for the first time, the following classes of persons abroad were allocated to their home States for inclusion in the apportionment population: (1) members of the Armed Forces; (2) civilian employees of any Federal department or agency who were citizens of the United States or who had a home State; (3) spouses and children who were living abroad with persons classified in groups 1 and 2 above; and (4) other relatives living abroad in groups 1 and 2 who were citizens of the United States or who had a home State.

For detailed information about apportionment methods, see House Report 91–1314: *The Decennial Population Census and Congressional Apportionment*, 1970.

Source: U.S. Bureau of the Census, *U.S. Census of Population: 1970*, vol. I, p. VIII.

See general note for series Y 215–271 for information about the apportionment population.

Y 220–271. Apportionment of membership in House of Representatives, by State, from adoption of Constitution to 1970.

Source: U.S. Bureau of the Census, *U.S. Census of Population: 1970*, vol. I, p. 53.

Membership is shown as of the date of the fixing of the new House apportionment plus members added for new States admitted during the subsequent decade. Major boundary changes affecting State representation in the House occurred in 1820, when Maine separated from Massachusetts, and in 1863, when West Virginia separated from Virginia.

Prior to 1850, apportionment ratios were chosen arbitrarily; from 1850 to 1900, ratios were the apportionment population of the United States divided by a predetermined number of Representatives; from 1910 on, apportionment ratios were computed by dividing a fixed number (435) of Representatives into the apportionment population. For additional information, see general note for series Y 215–271.

Series Y 1–26. Methods of Electing Presidential Electors: 1788 to 1836

[L—by legislature; G T—by people, on general ticket; D—by people, in districts; A—by people, in the State at large; E—by electors. The number in parentheses following the symbol "D" is the number of districts into which the State was divided. As a rule, each district elected 1 elector. The number in parentheses following the symbol "A" is the number of electors elected at large]

[1] A majority of the popular vote was necessary for a choice. In case of a failure to elect, the legislature supplied the deficiency.

[2] A majority of votes was necessary for a choice. In case of a failure to elect 1 or more electors a second election was held by the people, at which choice was made from the candidates in the first election who had the most votes. The number of candidates in the second election was limited to twice the number of electors wanted.

[3] 1 district chose 6 electors; 1, 5 electors; 1, 4 electors; 2, 3 electors each; and 1, 1 elector.

[4] A majority of votes was necessary for a popular choice. Deficiencies were filled by the General Court, as in 1792. It also chose 2 electors at large. In 1796 it chose 9 electors, and the people, 7.

[5] 2 of the districts voted for 5 members each, and 2 for 3 members each. A majority of votes was necessary for a choice. In case of a failure to elect by popular vote the General Court supplied the deficiency. In the election of 1792, the people chose 5 electors and the General Court, 11.

[6] Each of the 8 districts chose 2 electors, from which the General Court (i.e., the legislature) selected 1. It also elected 2 electors at large.

[7] 1 district elected 3 electors; 2, 2 electors each; and 27, 1 elector each. The 34 electors thus elected chose 2 presidential electors.

[8] Each qualified voter voted for 1 elector. The 3 electors who received most votes in the State were elected.

[9] 1 district chose 4 electors; 1, 3 electors; 1, 2 electors; 1, 1 elector.

[10] During the years 1804–1828, Maryland chose 11 electors in 9 districts, 2 of the districts elected 2 members each.

[11] The State was divided into 4 districts, and the members of the legislature residing in each district chose 3 electors.

[12] 2 districts chose 5 electors each, and 1 chose 4 electors.

[13] Each district elected 4 electors.

[14] In 1796 and 1800, Tennessee chose 3 presidential electors—1 each for the districts of Washington, Hamilton, and Mero. 3 "electors" for each county in the State were appointed by the legislature, and the "electors" residing in each of the 3 districts chose 1 of the 3 presidential electors.

[1] Mississippi, Texas, and Virginia did not participate in the election.
[2] Confederate States did not participate in the election.
[3] Florida (in 1868) and Colorado (in 1876) cast 3 Republican electoral votes through its legislature rather than by popular vote.
[4] South Carolina chose its electors through its legislature.

Series Y 79–83. Electoral and Popular Vote Cast for President, by Political Party: 1789 to 1968

[Excludes unpledged tickets and minor candidates polling under 10,000 votes. Various party labels may have been used by a candidate in different States; the more important of these are listed below]

Year	Number of States	Presidential candidate	Political party	Vote cast	
				Electoral	Popular
	79	80	81	82	83
1968	50	Richard M. Nixon	Republican	301	31,785,480
		Hubert H. Humphrey	Democratic	191	31,275,166
		George C. Wallace	American Independent	46	9,906,473

– Represents zero.

[1] Total vote for Gregory includes write-in votes as well as votes for the Freedom and Peace Party, the Peace Freedom Alternative, the Peace and Freedom Party, and the New Party.

[2] Total vote for McCarthy includes write-in votes as well as votes for the Alternative in November Party, and the New Party.

[3] 6 Democratic electors in Alabama, all 8 unpledged Democratic electors in Mississippi, and 1 Republican elector in Oklahoma voted for Senator Harry F. Byrd.

[4] 1 Democratic elector in Alabama voted for Walter Jones.

[5] Includes a variety of joint tickets with People's Party electors committed to Bryan.

[6] Greeley died shortly after the election and presidential electors supporting him cast their votes as indicated, including 3 for Greeley, which were not counted.

[7] Whig tickets were pledged to various candidates in various States.

[8] No candidate having a majority in the electoral college, the election was decided in the House of Representatives.

[9] Prior to the election of 1804, each elector voted for 2 candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President, the next highest, Vice President. This provision was modified by adoption of the 12th amendment, which was declared ratified by the legislatures of three-fourths of the States in a proclamation of the Secretary of State, Sept. 25, 1804.

Series Y 84–134. Electoral Vote Cast for President, by State and Political Party: 1804 to 1968

[Electoral votes are given for the period following the revision of the method of election in 1804, using these letter symbols for the various political parties: A—American; AJ—Anti-Jackson; AM—Anti-Masonic; C—Coalition; CU—Constitutional Union; D—Democratic; DR—Democratic-Republican; F—Federalist; N—Nullification; NR—National Republican; PP—People's Party; PR—Progressive; R—Republican; SD—Southern Democratic; SR—States' Rights; W—Whig. In the 1824 election, party lines were so indistinct that names of the individual candidates have been used]

[1] 6 electors voted for Harry F. Byrd.
[2] 1 elector voted for Walter Jones.
[3] 8 electors voted for Harry F. Byrd.
[4] 1 elector voted for Harry F. Byrd.
[5] Electors classed here as Democratic were elected in many States on joint Democratic and People's Party fusion tickets.
[6] Electoral votes from Arkansas and Louisiana were not counted. Due to the death of Greeley, Democratic electors divided their votes among Hendricks (42), Brown (18), Jenkins (2), and Davis (1).
[7] Mississippi, Texas, and Virginia did not participate in the election.
[8] Confederate States did not participate in the election.
[9] Excludes 3 votes for Greeley, which were not counted.
[10] 1 each for Republican, Democratic, and People's Party.
[11] Whig electors divided their votes among Harrison (73), White (26), and Webster (14).
[12] Vote was as follows: 2 for Crawford, 1 for Adams.
[13] 1 elector did not vote.
[14] Vote was as follows: 2 for Jackson, 1 for Adams.
[15] Vote was as follows: 3 for Jackson, 2 for Adams.
[16] 2 electors did not vote.
[17] Vote was as follows: 7 for Jackson, 3 for Adams, 1 for Crawford.
[18] 3 electors did not vote.
[19] 1 elector voted for John Quincy Adams.
[20] Vote was as follows: 26 for Adams, 5 for Crawford, 4 for Clay, 1 for Jackson.
[21] 6 electors voted for George Clinton.

Series Y 135–186. Popular Vote Cast for President, by State and Political Party: 1836 to 1968

[In thousands. Rep.—Republican; Dem.—Democratic; A.I.—American Independent. Vote listed is normally that of the highest candidate for presidential elector for each party]

Series Y 135–186. Popular Vote Cast for President, by State and Political Party: 1836 to 1968—Con.

[**In thousands.** Rep.—Republican; Dem.—Democratic. Vote listed is normally that of the highest candidate for presidential elector for each party. Democratic vote in 1896 and 1900 includes a variety of joint elector tickets with the People's Party, and party totals generally include votes cast for the presidential candidate under other designations than that of the party itself]

[1] Excludes the population of the District of Columbia, the population of outlying areas, the number of Indians not taxed, and (prior to 1870) two-fifths of the slave population. [2] Actual number apportioned at the beginning of the decade.
[3] Includes 1,575,000 persons in population abroad; see text.
[4] No apportionment was made after the census of 1920.
[5] Amended by the act of May 30, 1872.
[6] Amended by the act of March 4, 1862
[7] Amended by the act of July 30, 1852.
[8] The minimum ratio of population to Representatives stated in the Constitution (art. I, sec. 2).

Series Y 220–271. Apportionment of Membership in House of Representatives, by States, From Adoption of Constitution to 1970

[Population figures used for apportionment purposes are those determined for States by each decennial census. No reapportionment based on 1920 population census]

[1] The minimum ratio of population to Representatives stated in the Constitution (art. 1, sec. 2).
[2] Membership temporarily increased to 437 after legislation granting statehood to Alaska and Hawaii in 1959. See footnote 6.
[3] Membership originally fixed at 283 but increased to 292 by act of May 30, 1872 (17 Stat. L. 192). See footnote 6.
[4] Membership increased from 233 to 241 by act of Mar. 4, 1862 (12 Stat. L. 353). See footnote 6.
[5] Membership increased from 233 to 234 by act of July 30, 1852 (10 Stat. L. 25). See footnote 6.
[6] Assigned after apportionment.
[7] Included in apportionment act in anticipation of statehood.
[8] Included in the 20 members originally assigned to Massachusetts but credited to Maine after its admission as a State, Mar. 15, 1820 (3 Stat. L. 555).

Chapter Y

Government Employment and Finances (Series Y 272-848)

Y 272–848. General note.

Governmental services in the United States are provided through a complex organizational structure made up of numerous public bodies and agencies. In addition to the widely recognized pattern of Federal, State, county, municipal, and township governments, there exist many offshoots in the form of single-function and multiple-function districts, authorities, commissions, boards, and other entities that have varying degrees of autonomy. The basic pattern differs widely from State to State. Within a particular State, the various classes of local units may also differ in their characteristics.

Identification and enumeration of governmental units is, of course, a prerequisite to comprehensive reports on their activities. Thus, the U.S. Bureau of the Census report, *Census of Governments, 1967*, vol. I, *Governmental Organization*, provides information on numbers of governmental units by type, size, and location.

The summary historical table from the 1967 Census of Governments, reproduced below, presents the numbers of different types of governmental units for 1942, 1952, 1957, 1962, and 1967.

Table I. Governmental Units, by Type: 1942 to 1967

Type of government	Number of units				
	1967	1962	1957	1952	1942
Total	**81,299**	**91,237**	**102,328**	**116,743**	**155,116**
U.S. Government	1	1	1	1	1
States	50	50	48	48	48
Counties	3,049	3,043	3,047	3,049	3,050
Municipalities	18,048	18,000	17,183	16,778	16,220
Townships and towns	17,105	17,142	17,198	17,202	18,919
School districts	21,782	34,678	50,446	67,346	108,579
Special districts	21,264	18,323	14,405	12,319	8,299

Comparable data for the number of governments are not available for earlier years, principally because definition of the concept of "a governmental unit" and enumeration of the units in existence are beset with many difficulties. Professor William Anderson of the University of Minnesota has done extensive work in this field, and the enumerations by the Bureau of the Census in 1942 and later reflect his contributions.

Anderson's monograph, *The Units of Government in the United States: An Enumeration and Analysis*, first published in 1934 and revised in 1936, was extensively revised in 1942 and finally republished in 1945 with an appendix comparing the author's enumeration of governments with that of the 1942 Census of Governments. (Public Administration Service, Chicago, 1945.) Anderson reported 175,418 governments in the United States in 1930–33 and 165,049 in 1941. The 1942 Census of Governments adopted a more selective definition, eliminating 9,729 school districts and 204 other units from enumeration as separate entities. Anderson reported that he had "good reason to believe that the Bureau's figures represent a more accurate enumeration." (Source cited above, p. 48.)

The comparative totals reported by Anderson, on the basis of his definitions and procedures, are summarized in table II.

A governmental unit as defined in the 1967 Census of Governments (*Governmental Organization*, cited above, p. 13) is as follows:

> A government is an organized entity which, in addition to having governmental character, has sufficient discretion in the management of its own affairs to distinguish it as separate from the administrative structure of any other governmental unit. To be counted as a government, any entity must possess all three of the attributes reflected in the foregoing definition: Existence as an organized entity, governmental character, and substantial autonomy.

Characteristics taken as evidence of the "essential attributes" of a separately existing governmental unit include organization, active operation, and the possession of specific corporate powers; the popular election or appointment of officers; the power to levy taxes or to issue debt that bears interest exempt from Federal taxation; responsibility for performing a function commonly regarded as governmental; public accountability; and considerable administrative and fiscal independence.

Despite the variety and apparent simplicity of these criteria, the proper classification of some local governmental entities remains doubtful and, in such cases, account has been taken of (*a*) local attitudes as to whether the type of unit involved is independent, and (*b*) the effect of the classification upon the collection and presentation of statistics of governmental finances and employment.

Table II. Governmental Units, by Type: 1930–33 and 1941

Type of government	1941	1930–33	Change in number
Total	**165,049**	**175,418**	**−10,369**
U.S. Government	1	1	–
States	48	48	–
Counties	3,050	3,053	−3
Incorporated places (cities, villages, etc., and D.C.)	16,262	16,366	−104
Towns (as in New England) and organized townships (in a total of 23 States)	18,998	20,262	−1,264
School districts	118,308	127,108	−8,800
Other units	8,382	8,580	−198

– Represents zero.

Two broad categories of governmental units may be distinguished —special-purpose organizations, such as school, park, and sanitary districts; and general-purpose governments, each with a broad spectrum of powers and duties, ranging in size from small village and town governments to the large metropolitan city, State, and Federal governments.

These diverse units can be represented by at least two kinds of measures that are universally applicable: (*a*) the number of persons serving in each governmental unit and their compensation, and (*b*) the broad financial aspects of the operations, as represented by revenues, expenditures, and indebtedness. The collection and reporting of such data are complicated by the large numbers and frequent changes of the governmental units to be covered, by changes (often unrecorded) in their internal structures and external relationships, and by the great diversity that exists in organizational forms, employment relationships, financial procedures, the adequacy and availability of records, and the categories and terminologies used in those records and in public reporting. For the most part, data for the Federal Government are derived from regular personnel and fiscal reports, published annually or oftener. Those for the States and large cities are compiled from annual public reports or other official records of each unit and its component organizational subdivisions; and those of other local governments are derived from surveys based on similar reports and records of carefully selected samples of each type of government.

Complete censuses of governments, covering governmental structure, personnel, expenditures, revenues, debt, and other selected aspects of all governments in the United States, were conducted for 1932, 1942, 1957, 1962, and 1967. Earlier periodic censuses (for decennial years for 1850–1890 and for 1902, 1912, and 1922) were narrower in scope, particularly with reference to expenditures and personnel.

The various censuses of governments and also the annual reports on personnel and finances, differ not only in completeness, but also in some of the basic concepts and classifications. Consequently, the preparation of historically comparable data covering all governmental units is extremely difficult. As is evident in the historical series for the Federal Government, events and changing concepts greatly affect the comparability, over long periods, of data for a single government. The problem of continuity in concepts and classifications is greatly multiplied in summaries for all governmental entities.

For such reasons, the consolidated historical series now available are for selected years beginning with 1902. The data available for earlier years are either inadequate for classifications now used or require more extensive reworking than could be achieved with available resources.

State and local government data in this chapter include Alaska and Hawaii for years after admission as States; they omit outlying areas of the United States. The District of Columbia is classified as a local government.

For references to publications containing the original data and statistics for individual State and local governments, see text for series Y 652–848.

For still another approach to the role of Government operations in the economy, see series F 66–70, reporting Government purchases of goods and services, in which the Federal Government totals for 1938–1970 are subdivided between national defense and other purposes. For national income originating in "Government" as an industry, see series F 141; and for estimates of "Government product" in the national income accounts, see series F 129.

Y 272–334. General note.

Statistics on government employment and payrolls in the United States appear in *The Trend of Government Activity in the United States Since 1900*, by Solomon Fabricant, assisted by Robert E. Lipsey, National Bureau of Economic Research, New York, 1952, pp. 161–203. Fabricant and Lipsey relate their figures to the government employment data for 1929–1949 and earlier periods published by the Office of Business Economics and predecessor agencies. The latter figures differ from the former chiefly in omitting, for national income accounts, all Federal Government employees abroad. Also differentiated are earlier estimates prepared for the National Bureau of Economic Research by Simon Kuznets in *National Income and Its Composition, 1919–1938*, New York, 1941, vol. II, pp. 811–826. This study did not have data from the Work Projects Administration-Bureau of Labor Statistics compilations noted below. For reference to other studies for earlier years, see text for series Y 332–334.

The WPA-BLS figures, mentioned above, cover 1929–1939. They were obtained as part of a larger survey of State and local governments conducted in 1938–1943 by the Bureau of Labor Statistics and financed and staffed by the Work Projects Administration. Annual estimates of employment and payrolls of State and local governments and the underlying detailed estimates of States, by classes of governments and major fields of employment, were published by the Bureau of Labor Statistics in *Employment and Pay Rolls of State and Local Governments*, January 1946.

Sample surveys by the Bureau of the Census began in 1940 on a quarterly basis, giving reports of January, April, July, and October data. School data prior to 1946 were from the Office of Education and reported only for State and local aggregates, so that pre-1946 detail by level and type of government relates only to the nonschool data.

State-by-State estimates were issued by the Bureau of the Census at least once a year from the early 1940's, except for 1951. Summary data were provided on the school (education) component, but other functional detail was supplied only for State and municipal governments until 1952. Development of separate payroll figures on full-time employees was begun in 1951, and derivation of employment figures on a full-time equivalent basis was initiated in 1952. Beginning with 1953, national and State-by-State data have been reported by function, on the full-time equivalent number of employees of State and local governments for the month of October (except 1957 data, which were for April).

Beginning with 1955, the Bureau of Labor Statistics assumed responsibility for providing monthly statistics on government employment and payrolls.

Both series Y 272–289 and Y 332–334 cover all types of special-purpose districts as well as general-purpose local governments and all branches of the State governments; and both include the employees of government utilities as well as of general government services and agencies. Education employment includes noninstructional staff and the educational employees of State as well as local governments. Both tabulations omit military personnel and persons on work relief.

Federal Government employment and payrolls for 1952–70, series Y 273 and Y 291, respectively, are derived from Civil Service Commission data. Prior to 1952, these figures (Y 273 and 291) are basically the Bureau of Labor Statistics figures and, therefore, differ in coverage and date from the Civil Service Commission's historical tabulations for the Federal Government alone (series Y 308–317).

Differences from labor force data.—Data collected from the governmental employers, such as the Bureau of the Census and Bureau of Labor Statistics compilations on public employment referred to above, necessarily differ from government employment statistics derived from broad surveys of the labor force (see, for example, series Y 332–334).

Data on the labor force, and therefore on government workers, are collected by the Bureau of the Census in monthly surveys and published in its *Current Population Reports*. These surveys involve direct personal interviews with selected samples of households throughout the Nation. Governments are listed as an industry group, and members of the labor force who report that they are government workers are so classified.

Y 272–307. Public employees and government monthly payrolls, by type of government, 1940–1970.

Source: 1940–1967, U.S. Bureau of the Census, *U.S. Census of Governments: 1967*, vol. 6, No. 5, *Historical Statistics on Governmental Finance and Employment*; 1968–1970, *Public Employment*, annual issues.

Data on Federal employment and payrolls were obtained from the Bureau of Labor Statistics (BLS) prior to 1952 and the Civil Service Commission since that time. BLS figures were based on Civil Service data. Substantially all basic data for State and local governments were collected by mail surveys of the Bureau of the Census. However, prior to 1946, data on school employment were derived from the U.S. Office of Education publication, *Biennial Survey of Education in the United States*.

The reports on public employment outline the development of the Bureau of the Census reporting of statistics on public employees and payrolls, record data for the years back to 1940, and provide information on the concepts and definitions used. Additional data on Federal, State, and local governments are contained in the *U.S. Census of Governments: 1957*, vol. 2, *Governmental Employment*; the *U.S. Census of Governments: 1962*, vol. 3, *Compendium on Public Employment*; and the *U.S. Census of Governments: 1967*, vol. 3, *Public Employment*.

Public employees, as defined for the purpose of the Bureau of the Census survey of government employment, include all paid officials and civilian employees of Federal, State, and local governmental units. Employees of contractors, persons working on a contract

basis, and persons on work relief are not considered public employees. The term, however, does include fee officials, paid volunteer firemen, student help, and other persons employed on a part-time basis even though they may receive only nominal compensation for their services. Military personnel and their pay are omitted.

Figures for full-time equivalent employees, series Y 273–289, represent the number of persons that could have been employed, for the payroll amounts reported, if all personnel were engaged on a full-time basis at the average monthly rates applying to full-time workers for the particular functions and levels of government involved. Full-time employees are those persons employed during the pay period for the number of hours per week prescribed for full-time work in the jurisdiction concerned. The term includes temporary and emergency employees working on a full-time basis during the pay period.

Payrolls, series Y 290–307, include salaries, wages, fees, and other compensation earned in the calendar month by officials and other employees. Amounts reported are gross pay before deductions for withholding taxes, retirement contributions, social security, and other purposes. Full-time payrolls, series Y 292–307, are amounts paid to full-time employees as defined above.

Figures for State governments include, in addition to data for the regular departments and agencies, data for boards, commissions, authorities, institutions of higher education, and other semiautonomous agencies of State government. State employees include all persons paid by the State government.

Figures for municipalities (series Y 283–284 and Y 301–302) are for city, borough, village, and—except in New England, New York, and Wisconsin—town governments. They include boards, commissions, and semiautonomous districts and authorities controlled by such governments, as well as the regular municipal departments and agencies. In a number of States, some or all of the public schools serving city areas are operated by city governments, and city figures include their employees.

Figures for counties (series Y 285–286 and Y 303–304) include data for semiautonomous county agencies and for public schools or school facilities operated by county governments in a few of the States.

Data on school districts are restricted to independent districts operating public schools. They do not include data for school systems operated by State, city, county, or township governments. Between 76 and 81 percent of all local government education employees in October of each year, 1946–1970, were employees of independent school districts.

In addition to townships of the Midwestern States, which have limited governmental functions and play a minor role, township data include figures for New England, New York, and Wisconsin towns, and Pennsylvania and New Jersey townships, where town and township governments are important in the local government structure. The New England town figures include school information for four States (all except New Hampshire and Vermont) in which town governments administer public schools. Data on special districts are for special-purpose units of local government set up to perform a specific service or services in a local area, but which are administratively and fiscally independent of the broader types of local government having jurisdiction in the area. These units range in size from drainage districts and other agricultural-resources districts having only intermittent activity or employment up to such entities as the Chicago Transit Authority, the Port of New York Authority, and other large-scale governmental employers.

Y 308–317. Paid civilian employment of the Federal Government, 1816–1970.

Source: U.S. Civil Service Commission, unpublished data.

The data for 1816–1891 were compiled by the Civil Service Commission from *Official Register of the United States;* for 1901–1911, from the *Annual Report* of the Civil Service Commission and *Official Register;* for 1908–1970, from the Civil Service Commission, *Annual Report* and *Federal Civilian Manpower Statistics,* formerly titled *Monthly Report of Federal Employment,* and supplemented throughout by Civil Service Commission records.

Prior to 1938, the data are for employees on the rolls, with or without pay; for 1938–1942, the number on the payroll with pay; and for 1943–1970, the number in active duty status.

Employees and officials of the legislative, judicial, and executive branches are included. Employees of the District of Columbia are not included; they are considered employees of a local government.

The figures exclude military personnel but include civilian employees of the military departments. However, mechanics and other workmen at army arsenals and navy yards are not included prior to 1881.

The data for the Post Office, series Y 314, exclude contractors but include substitutes, partly estimated.

Series Y 311 represents personnel employed under the act of January 16, 1883, establishing the Civil Service Commission and the competitive (classified) service. This service includes all civilian positions in the executive branch of the Federal Government that are not specifically exempted by or pursuant to statute, or by the Civil Service Commission. It also includes all positions in the legislative and judicial branches which are specifically made subject to the civil service laws by statute. Figures represent positions, including vacancies, prior to 1947; since 1948, they represent employees serving under competitive appointment, primarily in the executive branch.

Y 318–331. Paid civilian employment in full-time positions in the Federal Government, 1948–1970.

Source: U.S. Civil Service Commission, *Pay Structure of the Federal Civil Service,* table 2, annual issues.

Over the years, the data in this table reflect increased coverage of paid Federal civilian employees. The data for 1948–1951 include only those employees in the conterminous United States; all later data are worldwide figures. Prior to 1954, only executive branch employees are shown; later data include all legislative branch employees except employees of Congress. Employees of the District of Columbia are not included as they are considered employees of a local government. The figures exclude military personnel but include civilian employees of the military departments.

Changes have also taken place over the years in the various employee pay systems. Data on the crafts, protective, and custodial schedule are shown for 1948–1951; some data on a different basis are also available in the annual issues cited above for 1952–1955. After 1955, this schedule was discontinued. The data for the Postal Pay Act do not include postal substitutes as full-time employees until 1953. Postal seasonal Christmas assistants are not included. The data for "other" employees include foreign nationals employed overseas after 1951.

Y 332–334. State and local government employment, 1929–1970.

Source: U.S. Bureau of Labor Statistics, *Employment and Earnings, United States, 1909–71,* BLS Bulletin 1312–8, p. 576.

Data for 1929–1939 are derived from a WPA-BLS survey (see general note for series Y 272–334). Figures for 1940–1954 are from Bureau of the Census reports on public employment and for 1955–1970, from Bureau of Labor Statistics compilations.

These series include regular full-time teachers for the summer vacation period, whether or not they were specifically paid in those months; elected officials of small local units and paid volunteer firemen are omitted as nominal employees.

Series Y 332–334 differ from series Y 274–276 because the former measure average monthly employment, whereas the latter are for October 31 of each year (except for 1957).

For a discussion of studies conducted by Federal agencies, see general note for series Y 272–334. Estimates of employment and payrolls for the years 1909–1927 appear in Wilford I. King, *The National Income and Its Purchasing Power,* National Bureau of

Economic Research, 1930, pp. 360–365; and for 1926, a study by William E. Mosher and Sophie Polah based on approximately 500 reports from State and local governments, published in "Public Employment in the United States," supplement to *National Municipal Review*, vol. XXI, No. 1, January 1932.

Relying heavily on the Mosher-Polah article and public employment data issued by the Bureau of Foreign and Domestic Commerce in connection with certain of its national income studies, Simon Kuznets, in *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, 1941, vol. II, pp. 811–826, published revised estimates of government employees and payrolls for 1919–1938.

Y 335–338. Summary of Federal Government finances—administrative budget, 1789–1939.

Source: U.S. Department of the Treasury, *Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970*, pp. 8–13 and 60–61.

Receipts and expenditures for 1789–1915 are based on warrants issued; for 1916–1939, on daily Treasury statements. Total gross public debt is on the basis of public debt accounts for 1791–1915, and on the basis of daily Treasury statements for 1916 to date. For description of the *Daily* and *Monthly Statements of the Treasury*, explanation of "warrants issued," "public debt accounts," and other pertinent items, see the source, pp. 1 and 2.

The receipts and expenditures data exclude amounts received in trust and expended from trust accounts. They also exclude amounts borrowed through the sale of Government securities and amounts paid to retire public debt. Receipts include the proceeds of sales of some types of Government-owned assets, including land. For recent years, however, proceeds from the disposition of some categories of Government property (including sales of commodities and securities purchased and repayments received on account of loans made by the Government) are reported as deductions from expenditures, rather than as receipts. Postal receipts and expenditures are included net for each year throughout the series; that is, a postal surplus is included in receipts and a postal deficit in expenditures.

Subject to the foregoing qualifications, figures for Federal Government receipts (series Y 335) represent "total receipts" through 1912 and "net receipts" thereafter. In determining net receipts, the following items are deducted from total receipts:

Refunds of receipts, principally for the overpayment of taxes, 1913–1939, are deducted from total receipts. (For earlier years, such refunds are included in expenditures.)

Certain interfund transactions are excluded from receipts and expenditures starting in 1932; for prior years, the amounts of such transactions are insignificant. Refunds of receipts are excluded from receipts and expenditures starting in 1913; comparable data are not available for prior years.

Transfers of tax receipts to the Federal old-age and survivors insurance trust fund from 1937; to the railroad retirement account from 1938.

Capital transfers, consisting of payments to the Treasury principally by wholly owned Government corporations for retirement of capital stock and for disposition of earnings. (Although the exclusion applies to all fiscal years for 1931–1939, the only transfer of this kind identified for that period was an item of $250 thousand in 1937.)

Figures for expenditures for 1931–1939 likewise are net of refunds paid and of capital transfers, but include any such payments in earlier years.

The surplus or deficit (series Y 337) is the difference between receipts and expenditures in any fiscal year. The change in public debt during any year is usually determined in large part by the surplus or deficit; it is, however, affected also by the increase or decrease in the Treasury cash balance and by various other financial operations. Consequently, there is only an approximate relationship between series Y 337 and the year-to-year differences in the debt reported in series Y 338.

For comments on the total gross public debt (series Y 338) and other aspects of the public debt, see text for series Y 493–504.

In a statement on "Some Historical Aspects of Federal Fiscal Policy, 1790–1956" (in *Federal Expenditure Policy for Economic Growth and Stability*, papers submitted by panelists appearing before the Subcommittee on Fiscal Policy, Joint Economic Committee, 85th Congress, 1st sess., Nov. 5, 1957, Joint Committee Print, pp. 60–83), the official historical series on Federal receipts and expenditures—such as series Y 335 and Y 336—were characterized by Professor Paul B. Trescott as subject to "certain deficiencies for the economist" stemming in part from "capricious patterns of inclusion and exclusion." Important before 1870, according to Trescott, was lack of conformity between the accounts of the Treasury, which the official data summarize, and the accounts of the collecting and disbursing officers who actually dealt with the public. He reported that the payment of $28 million of surplus revenue to the States in 1837 was omitted from Treasury accounts; that more than $100 million reported in Treasury figures of expenditures in the Civil War years was accumulated in disbursing officers' balances; and that various other adjustments were desirable. In compiling alternative totals of receipts and expenditures on the basis of various official records additional to Treasury accounts, Trescott has adopted special concepts, so that the resulting totals are designed primarily to measure money-flows. To some extent, his work incorporates a revised expenditure series compiled by M. Slade Kendrick in *A Century and a Half of Federal Expenditures*, National Bureau of Economic Research, New York, Occasional Paper 48, revised, 1955. Kendrick's data are as nearly as possible on a cash-payment basis for 1917–1952 (see Appendix B, especially p. 67).

The adoption of the unified budget concept reflected in series Y 339–342 was in part designed to eliminate these problems of comparability, but the data have not been worked back prior to 1954. From 1940 to 1953 the consolidated cash data shown in series Y 339–342 are closer to the concept currently in use than the administrative budget, while the only official data available for years prior to 1940 are the administrative budget figures.

The differences between the administrative budget and consolidated cash statement were slight prior to the mid-1930's when the Social Security trust funds began. From 1934 to 1939, cash receipts totaled $30.3 billion and administrative budget receipts totaled $26.2 billion; cash payments totaled $45.4 billion while administrative budget expenditures were $44.9 billion; the cash deficit totaled $15.0 billion and the administrative budget deficit totaled $18.7 billion.

Y 339–342. Summary of Federal Government finances, 1929–1970.

Source: U.S. Office of Management and Budget. For all series, 1929–1939, unpublished data. Series **Y 339–341**, 1940–1970, *The Budget of the United States Government, 1973*, p. 553. Series **Y 342**, 1940–1962, *Federal Government Finances* (unbound mimeographed tables); 1963–1970, *The Budget of the United States Government, 1973*, p. 543.

The unified Federal budget concept was first introduced in 1968 to incorporate reforms recommended by the President's Commission on Budget Concepts, whose report was published in 1967. Among the principal recommendations of the Commission incorporated into the new unified budget concept are the following:

(1). The Federal budget should include all federally controlled funds—whether labeled "Federal funds" or "trust funds"—so that it provides a picture of the total impact of the government on the economy.

(2). Any privately-owned activities—even if federally chartered—are not to be included in the Federal budget.

(3). Federal receipts shall consist of all income which arises out of the Government's sovereign capacity to govern (that is,

taxes and compulsory payments plus unfettered gifts to the Government). All income derived from business-type activities (such as the sale of public lands) are recorded as negative outlays.

The objective was to provide a consistent, comprehensive overview of total Federal finances regardless of the legal technicalities over who "owns" the money the Federal Government controls.

In order to provide comparable data over a period of years, the Bureau of the Budget (now Office of Management and Budget) and the Department of the Treasury jointly produced a set of data back to 1954. It was felt that the differences from the consolidated cash statement were too minor to warrant the additional work required to produce completely comparable data for earlier years. For most purposes there is no serious discontinuity in using the consolidated cash data for the 1940–1953 period and unified budget data for subsequent years. For example, over the period from fiscal year 1954 to 1958 the consolidated cash receipts averaged only 3 percent higher ($1.9 billion annually) than the unified budget receipts; cash payments averaged 2½ percent higher ($1.6 billion annually) than unified budget outlays; and the cash statement averaged a $.03 billion surplus while the unified budget averaged a $.3 billion deficit.

The consolidated cash statement was the broadest budgetary measure of Federal finances prior to the adoption of the unified budget. It differs from the unified budget primarily for the following reasons:

(1). The cash statement has a much more inconsistent treatment of income from business types of transactions. It treats large amounts of such income as offsets to outlays (called payments in the cash series) whereas other large amounts of such income are included in receipts.

(2). The cash statement includes transactions of wholly privately-owned enterprises (such as the Federal Home Loan Banks).

(3). The cash statement records interest when the cash is paid; the unified budget records interest when it is earned (accrued).

Consolidated cash data for current periods are no longer being produced since the existence of alternative budget concepts creates inordinate confusion.

At the same time that the budget concepts were reformed the debt concepts were also reformed; for many years there were two principal debt concepts: Public debt and debt subject to the debt limit. The public debt is that debt which originates from the Treasury Department. For most of our history this was the total debt, but in the past few decades the Congress has authorized other agencies (such as the Tennessee Valley Authority and the Federal Housing Administration) to borrow money without going through the Treasury Department. As a result, the public debt series does not include several billion dollars worth of Federal debt. The debt subject to limit includes almost all public debt but only part of the agency debt. Hence, a new comprehensive debt series was developed which includes both public and agency debt. This debt series is called "Gross Federal debt" (series Y 342 and Y 488) and data on a comparable basis have been compiled back to 1939. The differences between the gross Federal debt and the public debt (series Y 338 and Y 493) are quite large in the 1939–1944 period because of the large volume of agency borrowing which occurred in the 1930's, particularly in 1934.

Y 343–351. Federal Government receipts, by source, 1940–1970.

Source: U.S. Office of Management and Budget, *Federal Government Finances* (unbound mimeographed tables), October 31, 1972.

For 1940–1953, data are consolidated cash totals; for 1954–1970, data are based on the unified budget concept. The cash data are comparable to the unified budget data except for the "other miscellaneous receipts and "total" columns, where the cash receipts include certain transactions that are offset against outlays in the unified budget. In general, these differences have no effect on the surplus or deficit. For further details, see text for Y 339–342.

Y 352–357. Federal Government receipts—administrative budget, 1789–1939.

Source: U.S. Department of the Treasury, *Statistical Appendix to the Annual Report of the Secretary of the Treasury, 1971*, pp. 8–12, except series Y 356, *Annual Report of the Secretary of the Treasury, 1946*, pp. 422–423.

See text for series Y 335–338, for a discussion of receipts according to the administrative budget concept.

Y 358–373. Internal revenue collections, 1863–1970.

Source: U.S. Department of the Treasury, *Annual Report of the Secretary of the Treasury, 1929*, pp. 419–424; *1946*, pp. 406–409; and *Statistical Appendix to Annual Report of the Treasury, 1970*, pp. 46–51.

The three *Annual Reports* overlap as to years covered. To the extent that they differ in the grouping of items in any given year, the tabulation shown here generally follows the latest compilation; however, some exceptions are indicated below.

In *Historical Statistics of the United States, 1789–1945*, series P 109–119, the corresponding figures exclude trust fund receipts for 1935–1945. The data shown here for series Y 358–373 follow later Treasury practice by including, among internal revenue collections, all taxes collected by the Internal Revenue Service, whether assigned to general revenue or to trust funds.

These data, from Internal Revenue Service reports of collections, differ from figures shown in other series. The variations reflect differences in the time or stage of operations when the receipts are recorded. Taxes are included in budget receipts when reported in the account of the Treasurer of the United States. Internal Revenue Service reports of collections through 1954 include taxes for which returns (and payments) were received in internal revenue offices. Under arrangements begun in 1950 for withheld individual income tax and old-age and survivors insurance taxes, and later extended to railroad retirement taxes and many excises, these taxes are paid directly into Treasury depositaries. The depositary receipts, issued as evidence of such payment, are attached to quarterly returns submitted to the Internal Revenue Service by employers and taxpayers. Under this procedure, the amounts are included in budget receipts in the month and year when the depositary receipts are issued. Effective July 1, 1954, this accounting practice was extended to Internal Revenue Service reports of collections, so that the reported collections after fiscal 1954 likewise include depositary receipts in the month when the depositary receipts are issued.

Excise taxes paid into depositaries cannot be fully classified in terms of specific taxes until the supporting returns are received. Consequently, the collections shown for designated excise taxes in fiscal years after 1954 are subject to an undistributed adjustment. (For the amounts involved, see *Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970*, p. 50.)

The principal taxes included in totals but not shown separately are as follows:

1863–1915. Income and profits, largely 1863–1874 and 1914–1915 (see comments below for series Y 359); corporation excise, 1910–1914; occupational (special) taxes, 1863–1871, 1898–1902, and 1915.

1916–1957. Occupational (special) taxes, 1916–1928; insurance, 1918–1922; soft drinks, 1918–1924; and agricultural adjustment taxes, 1934–1936.

Y 358, total collections. For items included in this series but not shown separately in series Y 359–373, see source publications.

Y 359, individual income taxes. Although not shown separately for 1863–1915, this was an important tax source under revenue legislation enacted during the Civil War. The first collections in 1863 and for other years are shown below as tabulated in the *Annual Report of the Secretary of the Treasury, 1929*, p. 419.

The income tax legislation of the Civil War period expired in 1871 (see text for series Y 393–411). The collections in 1895 were under an act of 1894 that was declared unconstitutional. This type of tax was not imposed in other years during 1872–1913. The amounts shown in table III for 1873, 1874, 1876, 1881, and 1884 were late collections.

Table III. Individual Income Tax Collections: 1863 to 1895

[In thousands of dollars. For years ending June 30]

Year	Amount	Year	Amount	Year	Amount	Year	Amount
1895	77	1874	139	1870	37,776	1866	72,982
1884	56	1873	5,062	1869	34,792	1865	60,979
1881	3	1872	14,437	1868	41,456	1864	20,295
1876	1	1871	19,163	1867	66,014	1863	2,742

Separate figures for the individual income tax collections are not available for 1914, 1915, and 1918–1924.

Since 1951, withheld income taxes and old-age and survivors insurance taxes on employees and employers, and since 1957, disability insurance taxes on employees and employers have been paid into the Treasury in combined amounts without separation as to type of tax. Since June 1965, hospital insurance taxes have been deposited in the same way. Similarly, since 1951 and 1957, respectively, the old-age and survivors insurance and the disability insurance taxes on self-employment incomes have been paid in combination with income tax other than that withheld. The distribution of these collections by type of tax is based on estimates made in accordance with section 201(a) of the Social Security Act (42 U.S.C. 401(a)). Included in income taxes withheld by employers for 1951–1956 are amounts subsequently transferred to the Government of Guam under an act approved August 1, 1950 (48 U.S.C. 1421h). Since 1956 these amounts are excluded.

The relative importance of withholding by employers as a method of income tax collection is shown in table IV for the period since withholding was instituted.

Table IV. Individual Income Tax Collections, by Method of Collection: 1943 to 1970

[In millions of dollars. For years ending June 30]

Year	Total	Withheld by employers	Other collections	Year	Total	Withheld by employers	Other collections
1970	103,652	77,416	26,236	1956	35,338	24,016	11,322
1969	97,440	70,182	27,258	1955	31,650	21,254	10,396
1968	78,252	57,301	20,951	1954	32,814	22,077	10,737
1967	69,371	50,521	18,850	1953	32,536	21,132	11,404

1962	50,650	36,246	14,403	1948	20,998	11,534	9,464
1961	46,153	32,978	13,175	1947	19,343	9,842	9,501
1960	44,946	31,675	13,271	1946	18,705	9,858	8,847
1959	40,735	29,001	11,733	1945	19,034	10,264	8,770
1958	38,569	27,041	11,528	1944	18,261	7,823	10,438
1957	39,080	26,728	12,302	1943	6,630	686	5,944

Y 360, corporation income taxes. Includes excess profits tax, 1917 and 1934–1946; unjust enrichment tax, 1937–1946; and undistributed profits tax, 1937–1939.

The corporation income tax law, effective March 1, 1913, was preceded by a corporate excise tax enacted in 1909, under which collections were as shown in table V (see Treasury Department, *Annual Report of the Secretary of the Treasury, 1929*, p. 420).

For 1914, 1915, and 1918–1924, the Treasury reports do not separate corporate income tax from individual income tax collections.

Collections shown for 1952–1970 include taxes on business income of exempt corporations. Also included is the income tax on the Alaska Railroad, which was repealed for taxable years after June 30, 1952.

Table V. Collections Under the Corporate Excise Tax Act of 1909: 1910 to 1914

[In thousands of dollars. For years ending June 30]

Year	Amount	Year	Amount
1914	10,671	1911	33,512
1913	35,006	1910	20,960
1912	28,583		

Y 361, employment taxes. Includes the employer, employee, and self-employed taxes for the Federal old-age, survivors, and disability insurance system; the Federal unemployment insurance tax on employers; and the railroad retirement tax on employers and employees. Collections are received in combination with individual income taxes and the distribution by type of tax is based on estimates, as noted above in text for series Y 359.

Omitted from this series are railroad unemployment insurance contributions, collected by the Railroad Retirement Board under the Railroad Unemployment Insurance Act of 1938, as amended (45 U.S.C. 360). Although based on payrolls, this levy is not considered an internal revenue tax.

State unemployment insurance taxes also are not internal revenue collections, although the proceeds are deposited in the unemployment trust fund in the Federal Treasury.

Y 362, estate and gift taxes. Comprises, for 1863–1871 and 1899–1907, taxes on legacies, successions, and inheritances. The estate and gift taxes are shown separately for 1917 and later in the Treasury reports cited above. The figures for 1917–1924 and 1927–1932, inclusive, are for estate tax only. As indicated below for series Y 440–449, estate tax rate increases under the Revenue Act of June 2, 1924, were repealed retroactively February 26, 1926. Gift tax rates levied in 1924 were also reduced retroactively by the act of 1926. Estate and gift tax collections reported for 1925 and 1926 may include amounts collected at the higher rates and subsequently refunded; the refunds were reported as expenditures rather than as deductions from revenue. (See Bureau of Internal Revenue, *Statistics of Income, 1946*, part 1, pp. 430–431; *Annual Report of the Secretary of the Treasury, 1926*, pp. 291 and 350; *1927*, pp. 965–966.)

Y 363–371 and **Y 373,** excise taxes. Series Y 363, excise taxes total, and series Y 366, manufacturers' excise tax subtotal, are shown for years in which these totals appear in the Treasury annual reports cited above. Taxes of these types were collected also in other years.

For the years for which they are shown, these totals include various taxes not specified in the table. The "manufacturers' excise taxes" include special taxes relating to manufacture and sale. For 1863–1868, the manufacturers' excise subtotal includes a tax on raw cotton. For 1916–1970, the series includes taxes on sales under the act of October 22, 1914; manufacturers', consumers', and dealers' excise taxes under war revenue and subsequent acts; and for 1932 and later, manufacturers' excises under the act of 1932, as amended. Excise taxes on soft drinks are in the total for series Y 363 but not in series Y 366.

Y 364, alcohol. Comprises taxes on distilled spirits, beer, wines, and other products and includes occupational taxes. Includes amounts collected by the customs service on imports of distilled spirits and beer. Beginning in 1954, the reported amounts include taxes collected in Puerto Rico on alcohol products of Puerto Rican manufacture coming into the United States.

Y 365, tobacco. Comprises taxes on cigarettes, cigars, and other tobacco products. Beginning in 1954, the reported amounts include taxes collected in Puerto Rico on Puerto Rican tobacco products coming into the United States.

Y 367, automobiles and accessories. Includes tax collected for "passenger automobiles and motorcycles," "automobile trucks and

buses," and "parts and accessories for automobiles." Tax on motorcycles repealed effective September 1, 1955; tax on parts and accessories for automobiles (except truck parts) repealed effective January 1, 1966.

Y 370, admissions. Comprises "general admissions" and "cabarets," as shown separately in the *Annual Report of the Secretary of the Treasury, 1970*, for 1936–1970. Tax repealed effective December 31, 1965.

Y 371, telephone, telegraph, radio, and cable facilities. Includes in all years the taxes on "telephone, telegraph, radio, and cable facilities," and also, for 1942 and later, the tax on "local telephone services." General and toll telephone and typewriter service reduced to 3 percent effective January 1, 1966; retroactively restored to 10 percent rate on June 28, 1968. Private communications service, telegraph service, and wire equipment service repealed effective January 1, 1966.

Y 372, capital stock tax. This tax was not levied for years ending in the period July 1, 1926, through June 30, 1932, and for years ending after June 30, 1945. Collections after the fiscal year 1950 are included in excises, series Y 363.

Y 374–380. Fiduciary income tax returns, 1937–1970.

Source: U.S. Internal Revenue Service, 1937–1965, *Statistics of Income, Fiduciary Income Tax Returns*; 1970, unpublished data.

These series were tabulated from returns (Form 1041) before official audit. All returns were used for 1937–1939, but only taxable returns were used for 1940–1951. Data for years after 1951 are based on a sample of returns filed. Prior to 1937, data for fiduciary income tax returns were shown combined with individual income tax returns.

Fiduciary returns show annual income from estates in process of settlement or any other trust for which the fiduciary acts as administrator. Only certain small trusts are excused from filing. For the period covered, returns were required if income equaled or exceeded the amounts specified for the following years:

Income of an estate—for 1937–1939, gross income of $5,000 or net income taxable to the fiduciary of $1,000; 1940, gross income of $800; 1941, gross income of $750; 1942–1947, gross income of $500; 1948–1970, gross income of $600.

Income of a trust—for 1937, gross income of $5,000 or net income taxable to the fiduciary of $1,000; 1938 and 1939, gross income of $5,000 or net income of $100; 1940, gross income of $800 or net income of $100; 1941, gross income of $750 or net income of $100; 1942–1947, gross income of $500 or net income of $100; 1948–1953, gross income of $600 or net income of $100; 1954–1970, gross income of $600 or any taxable income of the fiduciary.

For any tax year, a return was required if any beneficiary of the estate or trust was a nonresident alien.

Total income (series Y 375) is gross income reported in accordance with the law for each tax year. For 1937–1952, this is after business and rental expenses and allowable loss from sales of capital assets and other property, and it includes capital gains as required under the various acts. For 1954 and later years, it includes gross profit from business, gross rents, and the entire capital gain without adjustment.

Net income or taxable income (series Y 376) as shown for 1954 and later years is less inclusive than the amounts shown for earlier years. For 1937–1952, this series represents total income less allowable nonbusiness deductions and the amount distributable to beneficiaries. For these years, it is not the amount taxed, since the exemption allowed to trusts and estates has not been deducted from the net income taxable to the fiduciary. For 1954 and later years, the series shows income taxable to the fiduciary. This is total income after deduction of the exemption as well as all business and rental expenses, the authorized nonbusiness deductions, distributions to beneficiaries, and the fiduciary's share of dividend exclusions and of long-term capital gain.

Y 381–392. Corporation income tax returns, 1909–1970.

Source: U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1909–1915, *Annual Report of the Commissioner of Internal Revenue*, various issues; 1916–1970, *Statistics of Income, Corporation Income Tax Returns*, annual issues.

Income tax returns are required annually of all corporations except those specifically exempt, such as fraternal, civic, and charitable organizations not operating for profit.

Data for 1909–1915 are from returns received during the fiscal year beginning July 1 of the year specified. The data for 1915 include information from approximately 32,000 returns received during the preceding fiscal year.

Data for 1916–1970 are for returns with accounting periods that ended between July 1 of the year specified and June 30 of the following year (for example, figures for 1916 are for accounting periods ending July 1, 1916, to June 30, 1917). A large proportion of the corporations' accounting periods coincide with the calendar year, and the calendar year is therefore used to identify the "income year." For the "income year" 1967, for example, 44.6 percent of the returns were for accounting periods that ended in December 1967; 22.5 percent for periods that ended during July–November 1967; 32.9 percent for periods that ended in the first half of 1968.

Data are based on returns as filed, prior to audit adjustments, carrybacks, renegotiation of war contracts, or other changes made after the returns were filed. For 1951–1970, data are based on a probability sample described in the annual *Statistics of Income*. Only the most important changes in law affecting historical comparability of the data can be noted here; others are specified in the annual *Statistics of Income*—for example, the varying provisions regarding life insurance company taxation.

Because of consolidated returns for affiliated corporations, the number of returns (series Y 381, Y 382, Y 386, and Y 392) is not the same as the number of corporations.

Total receipts of the corporations (series Y 383 and Y 387) include gross sales and receipts from operations, interest less amortizable bond premium, rents, royalties, net gain from capital assets (as defined by law) and other property, dividends, and other taxable income—all before "total deductions." These series also include nontaxable dividends from domestic corporations for 1918–1935 and nontaxable interest, but exclude all other nontaxable income. The data for 1916–1922 represent gross income. This was smaller than the total receipts by the amounts of wholly tax-exempt interest received on certain government obligations and, for 1918–1921, of nontaxable dividends.

Total deductions include the cost of goods sold and (beginning in 1932) the cost of operations, as well as other negative amounts reported under sources of income.

Net income (less deficit) (series Y 384 and Y 388) is gross taxable income less allowable current-year deductions, except statutory deductions. This category excludes tax-exempt interest on government obligations and, for 1918–1935, dividends from domestic corporations; these are included in total receipts. Beginning in 1936, contributions or gifts were deductible in determining net income. A deduction for amortization of emergency facilities was first allowable in 1940; the deduction was later extended to grain facilities and other items. Beginning with 1963, net income (less deficit) includes constructive taxable income from related foreign corporations.

Income tax (series Y 389), as shown for 1909–1915, represents tax collections. For 1909–1912, these amounts correspond to the corporate excise tax collections noted for the fiscal years 1910–1913 in the text for series Y 360, above. For the income year 1913, the amount represents income tax and excise tax. Beginning with 1916, "income tax" is the tax liability on the returns, but before deduction of credit for taxes paid to foreign countries or U.S. possessions. For 1936–1938, the amounts include surtax on undistributed profits, as well as normal tax. For 1940 and 1941, the series includes the income defense tax; for 1941–1970, normal tax and surtax; for 1942–1970, alternative tax; for 1963–1970, tax from recomputing prior year

investment credit; for 1967–1970, the surcharge; for 1969–1970, the additional tax for tax preferences.

Excess profits tax (series Y 390) for 1917–1922 comprises war profits tax and excess profits tax, and for 1933–1945, a declared-value excess profits tax effective for tax years that ended before July 1, 1946. Data for 1940 include the declared-value excess profits defense tax, and for 1940–1946, the excess profits tax under the Second Revenue Act of 1940. Amounts for 1942–1944 are for tax liability on the excess profits tax returns less a credit for debt retirement and the net postwar refund. Deferments under section 710(a)(5) of the 1939 Internal Revenue Code (relating to abnormalities under section 722) are reflected in the data for 1942 but not for 1943–1946. Amounts for 1943–1946 are after adjustments under various other relief provisions. The data for 1950–1954 are for the excess profits tax effective with respect to tax years from July 1, 1950, to December 31, 1953. For all years, the tax shown is before credit for foreign taxes paid.

Dividends paid (series Y 385 and Y 391) exclude liquidating dividends. They include all other dividends. In including dividends paid in the corporation's own stock, this series differs from similar series published elsewhere (e.g., U.S. Bureau of the Census, *Statistical Abstract of the United States, 1973*, table 640). For selected years, the amounts paid in stock, as included in the historical table, are as shown in table VI.

Table VI. Stock Dividends Paid: 1935 to 1970

[In thousands of dollars]

Income year	Included in series Y 385	Included in series Y 391	Income year	Included in series Y 385	Included in series Y 391

Inactive corporation returns (series Y 392) are those which show no items of income or deductions.

Y 393–411. Individual income tax returns, 1913–1970.

Source: U.S. Internal Revenue Service, *Statistics of Income, Individual Income Tax Returns*, annual issues.

The data represent returns of residents and citizens, including those with addresses outside Alaska, Hawaii, and conterminous United States. Detailed tabulations for each year, 1961–1970, with data by levels of gross income and by States, appear in *Statistics of Income, 1970, Individual Income Tax Returns*, 1970, pp. 307–322.

As noted above in the text for internal revenue collections (series Y 359), the individual income tax has been a continuing element of the revenue system since 1913, but was included in Federal revenue legislation in two earlier periods.

During the Civil War decade, this tax was included in the first revenue act of the war, in 1861, at a flat rate of 3 percent on incomes above $800. Before the initial rate took effect, it was superseded in 1862 by rates of 3 percent on up to $10,000, 5 percent above that amount of net income, and an individual exemption of $600. Rates were raised further in 1864. The highest rates, levied for a single year, were 10 percent on net income of $600 to $5,000, 12.5 percent on $5,000 to $10,000, and 15 percent above $15,000. In 1867, the rate became a flat 5 percent on income of more than $1,000; for 1870 and 1871, the rate was 2.5 percent and the exemption $2,000. The law expired at the end of 1871.

An individual income tax law adopted in 1894 was patterned generally after the law of 1867. It provided a 2 percent tax rate on individual and corporate net income, with a $4,000 exemption for individuals. Personal property received by gift or inheritance was to be included in net income. The act was declared unconstitutional in 1895 in a Supreme Court decision (Pollock v. Farmers' Loan and Trust Co., 157 U.S. 429, 158 U.S. 601). The personal income tax was not again levied until after adoption in 1913 of the Sixteenth Amendment to the Constitution. For data showing individual income tax collections covering the period 1863–1895, see text for series Y 359.

The data for 1913–1970 relate to returns filed under the income tax laws of 1913 and subsequent years. A return is required of every citizen or resident with gross or net income above a specified minimum. The requirements for filing have changed from time to time and are summarized below.

Table VII. Requirements for Filing Individual Income Tax Returns: 1913 to 1970

Year	Return required if net or gross income equaled or exceeded amount specified	
	Single, or married and not living with spouse	Married couple, joint return [1]
1970	Gross, $1,700 [2]	Gross, $2,300 [3]
1954–1969	Gross, $600 [4]	Gross, $600 each spouse [4]
1948–1953	Gross, $600	Gross, $600 each spouse
1944–1947	Gross, $500	Gross, $500 each spouse
1942–1943	Gross, $500 [5]	Gross, $1,200 [6]
1941	Gross, $750	Gross, $1,500
1940	Gross, $800	Gross, $2,000
1932–1939	Net, $1,000 or gross, $5,000	Net, $2,500 or gross, $5,000
1925–1931	Net, $1,500 or gross, $5,000	Net, $3,500 or gross, $5,000
1924	Net, $1,000 or gross, $5,000	Net, $2,500 or gross, $5,000
1921–1923	Net, $1,000 or gross, $5,000	Net, $2,000 or gross, $5,000
1917–1920	Net, $1,000	Net, $2,000
1913–1916	Net, $3,000	Net, $3,000

[1] Through 1943, amount shown is combined net or combined gross income.
[2] Gross income of $2,800 if age 65 or over.
[3] Gross income of $2,900, if one spouse age 65 or over; $3,500 if both age 65 or over.
[4] Gross income of $1,200 for each person age 65 or older.
[5] Also, for 1943, required to file if liable for 1942 tax, regardless of 1943 gross income.
[6] Also, for 1943, required to file if gross income of either spouse exceeded $624 or if either was liable for 1942 tax, regardless of 1943 gross income.

A joint return could be filed by husband and wife if income of both was included or if one spouse had no income.

For 1951–1970, a return was required of any individual whose net earnings for self-employment tax were $400 or more, regardless of the gross income requirement for filing.

In addition, under the current tax payment system instituted in 1943, returns were filed to claim refunds of taxes overpaid, even though the individual was not otherwise required to file.

Fiduciary income of an estate or trust for 1913–1936 was reported on an individual return form when there remained in the hands of the fiduciary net income which was taxable to him and not distributed to beneficiaries. Such a return for net income taxable to the fiduciary was required under the same conditions as those stated above for single persons during this period.

Data for 1913–1915 were derived from annual reports of the Commissioner of Internal Revenue, net income being determined on the basis of number of returns filed and the average net income in each class. Subsequent data were taken from returns, unaudited except to insure proper execution. Data for 1916 were tabulated from each return, but for later years were compiled by sampling techniques to represent the universe of returns, Form 1040 and 1040A (replaced by W-2 for 1944–1947). Tabulated data cover individual and fiduciary returns with net income of $3,000 or more, 1913–1916; returns with net income of $1,000 or more, 1917–1920; returns with net income, 1921–1927; all individual and fiduciary returns with net income, but only individual returns with no net income, 1928–1936; individual returns with net income or no net income, 1937–1943; and individual returns with adjusted gross income or no adjusted

gross income, 1944–1970, except that returns with no information were excluded for 1953–1956.

In the great majority of cases, the returns are for the calendar year, although some returns are for accounting periods ended during the calendar year. Also, some returns cover income attributable to several tax years. Prior to 1957, the tabulations of adjusted gross income (series Y 397) included only income attributed to the current tax year. For 1957 and later years adjusted gross income includes the whole amount received by the taxpayer within his tax year even if it was reported as income earned over a period of time that included prior tax years.

Adjusted gross income for 1944–1970 is total income reported for tax purposes less deductions for certain expenses generally related to the acquisition of income. These deductions include business and rental expenses, certain travel and transportation expenses of employees, depreciation allowed life tenants of property held in trust, allowable loss from the sale of capital assets and other property, adjustments for long-term capital gain, net operating loss deductions, and for 1954–1970, excludable sick pay, the limited exclusion of dividends, and expenses of salesmen. For 1964–1970, deductions of expenses of employees moving to a new job and deductions of pension plan contributions of self-employed persons were allowed.

Under the Internal Revenue Code of 1954, taxable income (series Y 398) for 1954–1970 is the base on which the tax is computed. It consists of adjusted gross income less nonbusiness deductions, standard or itemized. Itemized deductions are for taxes, contributions, interest, and other specified purposes, and also include all personal exemptions. The figures for taxable income embrace all returns, including those showing the so-called "optional tax," i.e., a tax determined by reference to a simplified tax table involving standard deductions rather than itemized nonbusiness deductions.

During 1948–1969, personal exemptions were $600 a year for each person—the taxpayer, his spouse, and dependents. A taxpayer aged 65 or older was allowed an additional $600 exemption for himself and, if a joint return was filed, for his wife if she was 65 or older. Likewise, an additional $600 exemption was allowed a blind taxpayer or a blind spouse. For 1970 the exemption amount was raised to $625.

Total income (series Y 405 and Y 409) for 1913–1943 is the gross income reported for income tax purposes under the act in effect for the income year. It is the total income after deduction of business and rental expenses and allowable loss on sales of capital assets and other property. Capital gain is included to the extent provided under successive acts.

Net income (series Y 406) for 1913–1943 is total income less authorized deductions. However, in the *Statistics of Income* for 1922–1931 the allowable prior-year loss was not deducted, and for 1924–1933 a capital loss that gave rise to a tax credit was not deducted. In the case of fiduciary net income, distribution to the beneficiary was an authorized deduction for 1913–1936. Net income in all years is measured before deduction of personal exemptions; it is not the tax base. The series is not available after 1943.

The small amounts of tax reported for 1938–1941 for returns with no net income (series Y 411) are an alternative tax on a small number of returns which showed a long-term capital loss and, for 1940 and 1941, a defense tax. For 1943, a victory tax was due on 17,438 returns with no net income.

Y 412–439. Individual income tax liability and effective rates, for selected income groups, 1913–1970.

Source: U.S. Department of the Treasury, unpublished data.

Maximum earned net income is assumed where it affects the amount of tax liability. In the case of the married couple (four exemptions), the computations assume prior to 1948 that only one spouse had income. Beginning with the income year 1948, all married couples have been permitted to combine their incomes in a joint return and to split the taxable income equally for purposes of the tax computation; a joint return on the split-income basis is therefore assumed for the married couple for the income years 1948–1970.

For the same years, persons of age 65 or older and blind persons were allowed additional exemptions; consequently, the illustrative data for 1948–1970 apply equally to any married couple claiming 4 exemptions, whether the additional exemptions were for dependents, age, or blindness.

The effective tax rate is the tax liability as a percentage of the amount of net income. The liability is the amount for income tax only, including the defense and victory taxes of 1940 and 1943; it does not include the self-employment tax for social security, applicable for 1951–1970.

Net income, as used here, is gross income (after 1943, adjusted gross income) minus nonbusiness deductions for contributions, interest, taxes, medical and dental expenses, and other allowable expenses, but before deduction of personal exemptions. Also excluded from net income (and from adjusted gross income) is tax-exempt interest on government obligations, excludable sick pay under the Revenue Act of 1954, certain expenses related to the acquisition of income, and other nontaxable income.

Statutory changes have been made from time to time in the allowable nonbusiness deductions. For example, the deduction for medical expenses was amended several times during 1944–1970. Another type of nonbusiness deduction, the amount allowed for contributions, was limited to 20 percent of adjusted gross income prior to 1954; for 1954–1970, taxpayers were allowed to deduct more than 20 percent to the extent that the excess (limited to 10 percent of adjusted gross income through 1969; 30 percent in 1970) was for contributions to hospitals, churches, or educational institutions.

In consequence of these and other changes, a given amount of net income could be associated with somewhat different amounts of gross income in different years. Even in any one year, a given amount of net income could be associated with different amounts of gross income for different taxpayers in accordance with their varying allowable deductions.

Beginning with the income year 1941, taxpayers with gross income of not more than $3,000 from specified sources were allowed to use a simplified return, Form 1040A, with the tax determined by a table that allowed a standard percentage of earned income credit and deductions from income. Taxpayers who did not use the short form were required to itemize deductions. In either case, the 1943 victory tax had to be computed separately. Legislation simplifying the filing of tax returns made available (beginning in 1944) the option of a standard deduction of 10 percent of adjusted gross income, limited to $500 for 1944–1947. For 1948–1970, the limit was raised to $1,000 for single persons and for married persons filing joint returns. In general, this implies that, for 1944–1947, net incomes of $4,500 or less and, for 1948–1970, net incomes of $9,000 or less, as shown in the table, would represent adjusted gross incomes at least ten-ninths as large. (That is, $800 net represents at least $889 of adjusted gross income; $1,000 net, at least $1,111 gross; $4,500 net, at least $5,000 gross; etc.)

For some types of analysis, effective rates based on gross rather then net income might be more pertinent. Such rates can be computed by making uniform assumptions about the deductions associated with the several specified levels of net income. For example, if it is assumed that the standard deductions made up the whole difference between adjusted gross and net income in cases in which the standard deduction was available, the effective percentage rate of tax on adjusted gross income in these cases would be nine-tenths of the effective rates shown in series Y 412–439. For another type of computation of effective tax rates, see Internal Revenue Service, *Statistics of Income, 1970, Individual Income Tax Returns*, p. 149.

The history since 1913 of the personal exemptions (including credits for dependents) and of the range of tax rates applicable to taxable individual incomes is summarized below in table VIII, from the following publications: 1913–1950, Treasury Department, *Annual Report of the Secretary of the Treasury, 1940*, pp. 466–467, and *1950*, p. 251; 1951–1957, Joint Economic Committee, *The Federal Revenue*

System: Facts and Problems, 1959, 86th Congress, 1st session, p. 189; and 1958–1970, unpublished Treasury Department data.

Table VIII. Federal Individual Income Tax Exemptions, and First and Top Bracket Rates: 1913 to 1970

Income year	Personal exemptions					Tax rates			
	Single	Married				First bracket		Top bracket	
		Dependents				Rate (percent)	Income	Rate (percent)	Income over–
		None	1	2	3				
1970 [1] [2]	$625	$1,250	$1,875	$2,500	$3,125	14	$500	71.75	$100,000
1969 [2] [3]	600	1,200	1,800	2,400	3,000	14	500	77	100,000
1968 [2] [4]	600	1,200	1,800	2,400	3,000	14	500	75.25	100,000
1965–1967 [2]	600	1,200	1,800	2,400	3,000	14	500	70	100,000
1964 [2]	600	1,200	1,800	2,400	3,000	16	500	77	200,000
1954–1963 [2]	600	1,200	1,800	2,400	3,000	20	2,000	[5] 91	200,000
1952–1953 [2]	600	1,200	1,800	2,400	3,000	22.2	2,000	[5] 92	200,000
1951 [2]	600	1,200	1,800	2,400	3,000	20.4	2,000	[5] 91	200,000
1950 [2]	600	1,200	1,800	2,400	3,000	17.4	2,000	[5] 84.36	200,000
1948–1949 [2]	600	1,200	1,800	2,400	3,000	16.6	2,000	[6] 82.13	200,000
1946–1947	500	1,000	1,500	2,000	2,500	19	2,000	[5] 86.45	200,000
1944–1945	500	1,000	1,500	2,000	2,500	23	2,000	[5] 94	200,000
1942–1943 [6]	500	1,200	1,550	1,900	2,250	[7] 19	2,000	88	200,000
1941	750	1,500	1,900	2,300	2,700	[7] 10	2,000	81	5,000,000
1940	800	2,000	2,400	2,800	3,200	[7] 4.4	4,000	81.1	5,000,000
1936–1939	1,000	2,500	2,900	3,300	3,700	[7] 4	4,000	79	5,000,000
1934–1935	1,000	2,500	2,900	3,300	3,700	[7] 4	4,000	63	1,000,000
1932–1933	1,000	2,500	2,900	3,300	3,700	4	4,000	63	1,000,000
1930–1931	1,500	3,500	3,900	4,300	4,700	[8] 1⅛	4,000	25	100,000
1929	1,500	3,500	3,900	4,300	4,700	[8] ⅜	4,000	24	100,000
1925–1928	1,500	3,500	3,900	4,300	4,700	[8] 1½	4,000	25	100,000
1924	1,000	2,500	2,900	3,300	3,700	[8] 1½	4,000	46	500,000
1923	1,000	[9] 2,500	2,900	3,300	3,700	3	4,000	56	200,000
1922	1,000	[9] 2,500	2,900	3,300	3,700	4	4,000	56	200,000
1921	1,000	[9] 2,500	2,900	3,300	3,700	4	4,000	73	1,000,000
1919–1920	1,000	2,000	2,200	2,400	2,600	4	4,000	73	1,000,000
1918	1,000	2,000	2,200	2,400	2,600	6	4,000	77	1,000,000
1917	1,000	2,000	2,200	2,400	2,600	2	2,000	67	2,000,000
1916	3,000	4,000	4,000	4,000	4,000	2	20,000	15	2,000,000
1913–1915	3,000	4,000	4,000	4,000	4,000	1	20,000	7	500,000

[1] Includes 2.5 percent surcharge, but lowest bracket unaffected; maximum effective rate on earned income is 60 percent.
[2] Additional exemptions of $600 ($625 in 1970) are allowed to taxpayers and their spouses on account of blindness and/or age 65 or older.
[3] Includes 10 percent surcharge, but lowest bracket unaffected.
[4] Includes 7.5 percent surcharge, but lowest bracket unaffected.
[5] Subject to maximum effective rate limitation: 90 percent for 1944–45, 85.5 percent for 1946–47, 77 percent for 1948–49, 80 percent for 1950, 87.2 percent for 1951, 88 percent for 1952–53, and 87 percent for 1954–59.
[6] Exclusive of victory tax.
[7] Before earned income credit allowed as a deduction equal to 10 percent of earned net income.
[8] After earned income credit equal to 25 percent of tax on earned income.
[9] If net income exceeds $5,000, married person's exemption is $2,000.

Y 440–449. Federal estate tax returns, 1916–1970.

Source: U.S. Internal Revenue Service, *Statistics of Income, Estate Tax Returns.*

These data are from returns filed, before audit. Data for returns filed in 1966 and 1970 are based on a sample.

The Federal estate tax is a levy upon the transfer of property by a decedent. It differs from inheritance taxes, in which, generally, the tax is on the privilege of receiving property by inheritance and is levied upon the heirs.

The base of the tax is the value of the gross estate transferred, adjusted for exclusions, deductions, and exemptions. The tax is imposed at graduated rates, and certain credits are allowed against the tax so computed.

The estate tax in its present form became a permanent part of the Federal tax system in 1916, but four times earlier death taxes had been imposed by the Federal Government. During 1797–1802, a stamp tax applied to succession to personal property by inheritance. The Civil War Revenue Act of 1862 included an inheritance tax which was substantially increased in 1864; this tax was repealed in 1870. The income tax act of 1894 included an inheritance tax that was abandoned when the income tax was declared unconstitutional. The Revenue Act of 1898, for financing the Spanish-American War, included a short-lived tax applicable to all estates of over $10,000, except those inherited by spouses.

Table IX summarizes the history of Federal estate tax rates and exemptions for 1916–1970. An estate tax return was required if the value of the gross estate at the date of death exceeded the allowable specific exemption as shown in the table and footnote 1.

The estate of an individual who died in the period June 6, 1932, through August 16, 1954, was subject to two estate taxes—basic and additional. Basic tax was at the rates provided in the 1926 act; additional tax was the excess of a tentative tax at rates provided by the act in force at date of death, over the basic tax. Under the 1954 Code, these two taxes were combined and a single tax rate applied to the net taxable estate.

Table IX. Estate Tax Rates, Specific Exemption, and Insurance Exclusion: 1916 to 1970

Date of death	Tax rates, range (percent)	Minimum rate applies to first—	Maximum rate applies above—	Specific exemption [1]	Insurance exclusion
Oct. 22, 1942–1970	3.0–77	$5,000	$10,000,000	$60,000	----------
Sept. 21, 1941–Oct. 21, 1942	3.0–77	5,000	10,000,000	40,000	$40,000
Aug. 31, 1935–Sept. 20, 1941	[2] 2.0–70	10,000	50,000,000	40,000	40,000
May 11, 1934–Aug. 30, 1935	1.0–60	10,000	10,000,000	50,000	40,000
June 6, 1932–May 10, 1934	1.0–45	10,000	10,000,000	50,000	40,000
Feb. 26, 1926–June 6, 1932	1.0–20	50,000	10,000,000	100,000	40,000
Feb. 24, 1919–Feb. 26, 1926	[3] 1.0–25	50,000	10,000,000	50,000	40,000
Oct. 4, 1917–Feb. 24, 1919	2.0–25	50,000	10,000,000	50,000	----------
Mar. 3–Oct. 3, 1917	1.5–15	50,000	5,000,000	50,000	----------
Sept. 9, 1916–Mar. 2, 1917	1.0–10	50,000	5,000,000	50,000	----------

[1] For estate of resident citizen or alien. The same specific exemption was granted for estates of nonresident citizens dying after May 10, 1934. Exemptions were not granted to estates of nonresident aliens until Oct. 22, 1942, when a $2,000 exemption became available.
[2] For deaths from June 26, 1940, to Sept. 20, 1941, a defense tax was added equal to 10 percent of the net estate tax (computed at the rates of 2 to 70 percent) after deduction of credits for gift taxes and State death taxes.
[3] Higher rates, ranging from 1 percent to a top-bracket rate of 40 percent on the excess over $10,000,000 were provided in the Revenue Act of June 2, 1924, but the rates of the 1921 act were restored retroactively Feb. 26, 1926. Refunds were authorized for overpayments made at the higher rates. The net tax (series Y 445 and Y 449) was computed at the lower rates (*Statistics of Income, 1925*, pp. 70–71, 82).
Source: Adapted from Internal Revenue Service, *Statistics of Income*, various issues; U.S. Department of the Treasury, *Annual Report of the Secretary of the Treasury, 1940*, pp. 478–479, and *1950*, p. 258.

A marital deduction for bequests to the surviving spouse applied to the estates of persons who died after 1947. The deduction is limited to the smaller of either one-half the value of the adjusted gross estate or the value of the qualifying property interests which pass to the surviving spouse. The impact of this provision is reflected in the statistics.

Gross estate (series Y 442 and Y 447) includes all property possessed to the extent of the decedent's interest therein at death, including certain transfers made during life without full consideration, joint estates, tenancies by the entirety, dower and courtesy of surviving spouse, and life insurance on the life of the decedent if the estate was administered under the 1942 or subsequent acts. The value of the gross estate may be either the value at date of death or as of the date one year after death, whichever the executor elected in case death occurred on or after August 31, 1935.

Net taxable estate (series Y 443 and Y 448) is gross estate less the deductions and specific exemptions allowed under the act in effect at date of death. These have varied somewhat among the different acts.

Y 450–456. Federal gift tax returns, 1924–1966.

Source: U.S. Internal Revenue Service, *Statistics of Income, Gift Tax Returns.*

These data are from returns filed, before audit. Data for returns filed in 1961, 1963, and 1966 are based on a sample. Data have not been tabulated in years for which no figures are shown.

The Federal gift tax, like the estate tax, is a levy upon transfers of property by gift. The tax is a liability of the person making the gift and is based upon the value of the transferred property.

The gift tax was first levied for 1924 and 1925. For these years, a return was required for gifts of property located in the United States, made by individuals, corporations, associations, partnerships, trusts, or estates, if total gifts exceeded the sum of authorized deductions for exemption, charitable gifts, and previously taxed property, and if the aggregate exceeded $500 to any one donee.

The present gift tax was introduced in 1932 in connection with substantial revisions in the estate tax. The rates were three-fourths of those in the estate tax, and this relationship was maintained through subsequent revisions (subject, however, to differences in the effective dates of rate and exemption changes). A return was required during 1932–1970 if aggregate gifts in the year to any donee exceeded the allowable annual exclusion per donee and for gifts of future interests regardless of value. Tax rates, specific exemptions, and annual exclusions are summarized in table X.

Table X. Gift Tax Rates, Exemptions, and Exclusions: 1924 to 1970

Calendar year of gift	Tax rates, range (percent)	Minimum rate applies to first—	Maximum rate applies above—	Specific exemption [1]	Annual exclusion per donee
1943–1970	2.25–57.75	$5,000	$10,000,000	$30,000	$3,000
1942	2.25–57.75	5,000	10,000,000	40,000	4,000
1939–1941	[2] 1.5–52.5	10,000	50,000,000	40,000	4,000
1936–1938	1.5–52.5	10,000	50,000,000	40,000	5,000
1935	75–45	10,000	10,000,000	50,000	5,000
1932 [3]–1934	75–33.5	10,000	10,000,000	50,000	5,000
1924 [4]–1925	1–25	50,000	10,000,000	50,000	500

[1] During 1924–1925, allowed in each calendar year; in later years, allowed only once.
[2] From June 26, 1940, through 1941, subject to additional defense tax equal to 10 percent of basic tax liability.
[3] In effect for gifts June 7, 1932, and later.
[4] In effect June 24, 1924.
Source: Adapted from Internal Revenue Service, *Statistics of Income*, various issues; U.S. Department of the Treasury, *Annual Report of the Secretary of the Treasury, 1940*, pp. 478–579, and *1950*, p. 258.

Since 1932 the tax has applied to individuals only (citizens, residents, or nonresident aliens) for transfer of property situated in the United States.

Gift tax rates are progressive in application; that is, current graduated rates are applied to (*a*) the aggregate net taxable gifts made after June 6, 1932, and to (*b*) the aggregate net gifts exclusive of those made in the current year—the excess of tax in (*a*) over (*b*) being the current tax liability.

As indicated in table X, the donor is allowed to exclude gifts of less than a specified amount to each recipient in each year. This annual exclusion was $3,000 for each donee for the years 1943–1970. In addition, a specific exemption ($30,000 during 1943–1970) is allowed each citizen or resident and may be taken, at his option, entirely in a single year or spread over a number of years. After April 2, 1948, a marital deduction of one-half of the value of gifts made between a husband and wife was allowed citizens and residents.

Total gifts (series Y 452 and Y 456) is the value of property (real property or tangible or intangible personal property) transferred without full consideration in money or money's worth, whether transferred in trust or otherwise, whether direct or indirect, or of future interests. Generally, gifts of less than the allowable annual exclusion for each donee are not reported, except that gifts of future interests must be included regardless of value (and, for 1939–1942, gifts in trust).

Net taxable gift (series Y 453) is the tax base. It is the value of total gifts minus the exclusion for each donee, deductions, and specific exemptions.

Source: All series except Y 463, U.S. Department of the Treasury, *Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970*, pp. 8–16. Series Y 463, 1789–1946, Department of the Treasury, *Annual Report, 1946*, pp. 422–423; 1947–1970, U.S. Office of Management and Budget (formerly Bureau of the Budget), *Budget of the United States Government*, annual issues, 1949–1970.

Data for 1954–1970 are unified budget outlays. For earlier years data are for the administrative budget, so they exclude expenditures from trust funds. Series Y 466–471 show consolidated cash data for the years 1940 through 1953. The consolidated cash data are more comparable to the unified budget data than are the administrative budget data, but data on cash payments by agency are not available.

In the case of public enterprise funds (including the postal service) and various intra-governmental funds, expenditures included in the total are on a *net* basis—that is, their collections are deducted from gross expenditures and the results are the net expenditures included in Federal Government expenditure accounts. In the case of the postal service, the net postal expenditure is included in the total and "other" (series Y 457 and Y 462) expenditures in the years in which there was a postal deficit. For a historical series showing gross postal expenditures in relation to postal receipts, see references in text for series Y 352–357.

Expenditures for 1789–1915 are based on warrants issued; for 1916–1952, on the *Daily Statement of the United States Treasury*; for 1953–1970, on the Treasury's *Monthly Statement of Receipts and Expenditures of the United States Government*.

In the *Monthly Statement*, expenditures are reported on the basis of checks issued by disbursing officers, except for interest on the public debt and payments made in cash. Where payment is made by the issuance of bonds or by an increase in their redemption value, instead of by the issuance of checks, such an issuance or increase is an expenditure. Interest on the public debt is reported on an accrual basis. For years prior to those reported in the *Monthly Statement*, interest on the public debt is reported on the same basis as other expenditures.

The figures for 1916–1952 were compiled from daily reports received by the Treasurer of the United States from Government depositaries and Treasury offices holding Government funds. On this basis, the expenditures include payments on checks outstanding at the beginning of the fiscal year and do not include checks unpaid at the end of the year. Beginning with the fiscal year 1947, expenditures of several departments and establishments were reported on the basis of checks issued, so that the detail in the daily statement was partly based on checks issued, partly on checks paid. The change to the monthly statement basis eliminated the necessity for showing an item of "adjustment to daily Treasury statement basis" in tabulations presenting components of the expenditure total.

Y 466–471. Outlays of the Federal Government, by major function, 1900–1939.

Source: U.S. Bureau of the Budget, unpublished data.

Basic data are from the following:

1900–1914. Adapted from Bureau of the Budget compilation for 1900–1948 in U.S. Congress, *Congressional Record*, 80th Congress, 2d session, vol. 94, pt. 2, March 11, 1948, pp. 2576–2577. Series Y 469, veterans services and benefits, supplied from the Treasury compilation in series Y 463 (see below). Tax refunds of $10 million a year deducted from 1913 and 1914 to conform to the *1959 Federal Budget Mid-Year Review* (September 1958), p. 42, where budget receipt and expenditure totals are shown for each year, 1900–1939, with refunds excluded starting in 1913.

1915–1920. *Congressional Record*, cited above, but with tax refunds deducted.

1921–1938. Unpublished Bureau of the Budget table for 1920–1939, September 17, 1958; but with series Y 468, International affairs and finance, supplied from *Congressional Record*, cited above.

1939. Unpublished Bureau of the Budget table for 1939–1950, February 1959.

As Federal Government operations expanded in volume and variety, the limited classification of expenditures exemplified in series Y 457–465 (even when supplemented with additional items and subdivided to give more specific categories) was inadequate to delineate the scope of Government programs and to focus attention on significant shifts in the purpose of expenditures. The text for series Y 472–487 explains the development to and definitions of the current Government expenditures.

Series Y 469, veterans services and benefits, may be slightly understated for 1900–1914, as it comprises only the payments for veterans compensation and pensions, the same as series Y 463. Any such understatement in series Y 469 apparently would not exceed $12 million a year and is balanced by an equal overstatement in the residual series, Y 471, for "All other."

Refunds are excluded from series Y 466–471 since 1912. Consequently, total expenditures, series Y 466, for 1913–1930 deviate from those shown in series Y 336 and Y 457 by the amount of refunds.

Y 472–487. Outlays of the Federal Government, by major function, 1940–1970.

Source: U.S. Office of Management and Budget, *Federal Government Finances* (mimeographed tables), October 31, 1972.

A systematic classification of expenditures by major functional categories and more specific subfunctions was introduced in the budget for the fiscal year 1948. Although each succeeding annual budget modified some of the categories or shifted particular items from one classification to another, continuity of the series was maintained by adjusting the data for prior years so that the data for each function is as consistent as feasible. Details concerning the composition of the classifications shown here (including the subfunctional groupings) may be found in the 1973 budget document.

In 1967 the President's Commission on Budget Concepts recommended substantial changes in the budget concept. These changes were first reflected in the 1969 Budget but the data were carried back on a comparable basis through 1954. While historical data on the current budget basis are not available prior to 1954, the consolidated cash statements are a reasonable approximation for earlier years. The principal differences between the cash and unified budget data are: (1) many proprietary receipts are included in the consolidated cash statement as income but are offsets to outlays under the unified budget, (2) the cash statement has certain timing adjustments not made in the unified budget, and (3) certain activities—such as two privately-owned but federally-chartered banking institutions—are included in the cash totals but excluded from the unified budget totals. In all cases, the functional data for the consolidated cash statement have been made as comparable as feasible; the discontinuities are concentrated in the unallocable column. For a more complete discussion see text for series Y 339–342.

For years prior to 1940, the figures in series Y 457–465 are a rough approximation of certain functional categories. The sum of expenditures for the Department of the Army and the Department of the Navy are roughly equivalent to the national defense function; interest on the public debt is roughly equivalent to the interest function, and veterans compensation and pensions (series Y 463) is roughly equivalent to veterans benefits and services (series Y 469).

Y 488–492. Gross Federal debt outstanding, 1939–1970.

Source: U.S. Office of Management and Budget, *Federal Government Finances* (mimeographed tables), October 31, 1972.

Gross Federal debt is the broadest generally used measure of the Federal debt. It is composed primarily of the public debt (direct borrowing by the Treasury) but also includes agency debt (such as borrowing by the Tennessee Valley Authority or the Postal Service). About three-fourths of the gross debt is held by the public, and about one-fourth is held by Government accounts. The Government-held debt results from the fact that the surpluses of trust funds are normally invested in public debt securities. The interest payments on this Government-held debt are made from one account within the budget to another account within the budget and do not, therefore, affect the budget deficit or surplus. Only the debt owed to the public gives rise to net budget expenditures for interest.

The Federal Reserve System is an independent, federally-chartered, central banking system. As the System is not included in the Federal budget, debt held by the System is included in "debt held by the public." Interest paid on Federal debt held by the System is not, therefore, an intrabudgetary transaction. However, since 1947 the Federal Reserve System has made annual payments to the Treasury from its surplus, which, in turn, arises primarily as a result of interest payments made by the Treasury to the Federal Reserve. In 1970, these payments amounted to $3.3 billion, equal to the bulk of interest payments to the Federal Reserve System. Thus, interest payments to the Federal Reserve System have very little net effect on the budget deficit or surplus.

This series differs from series Y 493–504, which excludes Federal agency debt issuances. See also text for series Y 493–504.

Y 493–504. Public debt of the Federal Government, 1791–1970.

Source: **Series Y 493–497**, U.S. Department of the Treasury, *Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970*, pp. 60–61. **Series Y 498–499**, 1855 and 1892–1915, U.S. Bureau of Foreign and Domestic Commerce, *Statistical Abstract of the United States, 1921*, p. 829; 1856–1891 and 1916–1970, U.S. Department of the Treasury, *Annual Report, 1891*, p. XCIV, *1946*, p. 546, and *Statistical Appendix, 1970*, pp. 220–221. **Series Y 500–504**, 1880–1915, U.S. Department of the Treasury, unpublished data; 1916–1970, *Annual Report, 1946*, p. 459, *1958*, pp. 472–473, *1967*, p. 506, and *Statistical Appendix, 1970*, p. 66.

The total public debt (series Y 493) as reported at the end of each fiscal period is essentially the formal funded debt of the Federal Government, both long-term and short-term. It includes savings bonds at current redemption value. It differs from gross Federal debt (series Y 488) in that public debt represents borrowing by the Department of the Treasury; gross Federal debt also includes borrowing by Federal agencies. (The Federal agency debt outstanding at the end of fiscal 1970 was $12.5 billion.)

Studies by Paul B. Trescott and others have suggested that the debt totals (series Y 493) as compiled by the Treasury Department for the early years of the Republic—1791 into the early 1800's—may omit obligations incurred otherwise than by the issuance of Treasury obligations and may include some contingent liabilities that would be excluded by the definitions adopted in later years. (Trescott, unpublished memoranda; see also Paul Studenski and Herman E. Krooss, *Financial History of the United States*, McGraw-Hill, New York, 1952, p. 3, footnote 1.) See also text for series Y 335–338.

Although nearly all the public debt is interest-bearing, the total includes some obligations that bear no interest and matured debt on which interest has ceased. In recent years, a substantial part of the public debt has been held in the trust funds and other Treasury investment accounts. (For the ownership of Federal public debt securities at several dates for 1960–1970, see the *Annual Report of the Secretary of the Treasury, 1970*, p. 14, and *Statistical Appendix* (ibid.), p. 230.) Certain unfunded obligations of the Government are not counted in the public debt—for example, a potential obligation of the Government for unpaid employer contributions to the civil service retirement and disability fund.

The formal concept of "the public debt," as used in Federal fiscal reports, appears to have emerged following initial enactment of a statutory ceiling on the debt of the Federal Government. Such a ceiling was first provided in the Second Liberty Bond Act of 1917; prior to May 26, 1938, the limitation applied to particular segments of the debt, not to the total. The debt ceiling has been modified from time to time in subsequent legislation. For a tabular summary of

the debt limit legislation, 1917–1970, see *Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970*, p. 108. See also Marshall A. Robinson, *The National Debt Ceiling, An Experiment in Fiscal Policy*, The Brookings Institute, Washington, D.C., 1959.

Despite the close relationship of "the public debt" (series Y 493) to the debt limitation, series Y 493 includes a relatively small amount of obligations not subject to statutory limitations. Robinson, cited above, points out (p. 8) that "the Federal debt is part of a larger structure of Federal Government obligations. . . . The legally defined gross Federal debt . . . is the debt that falls under the debt limitation, and it is what general usage calls the national debt." For a rough estimate of some additional obligations not included in "total gross debt," see a compilation by the Comptroller General of the United States, in *Investigation of the Financial Condition of the United States: Hearings Before the Senate Committee on Finance*, 85th Congress, 1st session, vol. 1, June 26, 1957, pp. 81–82, 269.

Various writers have contended that the most meaningful measure of the national debt in economic terms is "debt owed to the public." "Debt held by the public," series Y 490, closely corresponds to this concept, which includes Federal agency as well as Treasury (public) debt issues.

The computed annual interest charge, series Y 498, represents the amount of interest that would be paid if each interest-bearing issue outstanding at the end of the year should remain outstanding for a year at the applicable annual rate of interest. The charge is computed for each issue by applying the appropriate annual interest rate to the amount outstanding on that date. The aggregate charge is the total of the computed amounts for all interest-bearing issues. The average annual rate is computed by dividing the computed annual interest charge for the total of outstanding issues by the corresponding principal amount. Beginning December 31, 1958, the computed average rate is based upon the rate of effective yield for issues sold at premiums or discounts. Before that date the computed average rate was based upon the coupon rates of the securities.

Y 505–848. General note.

The concepts and terms used in these series were originally developed for the Bureau of the Census reporting on finances of State and local governments. These concepts have also been applied to Federal Government data to provide comparable comprehensive aggregates covering all levels of government.

For a full discussion of basic concepts and terminology and of the classifications of revenue and expenditure, see the source for years 1902–1967 for series Y 505–566, pp. 1–12. A few of the more important items are discussed here.

General revenue and general expenditure, as used in these series, refer to all sources or purposes other than certain specifically defined utility, liquor store, and insurance trust operations.

Intergovernmental revenue and intergovernmental expenditure refer to transactions between the Federal, State, and local governments. To avoid double counting, such transactions are netted out of aggregates comprising the groups of governments concerned. Transactions with governments of other countries are not defined as intergovernmental. The value of intergovernmental aid "in kind" (for example, commodities or other property given by the Federal Government to State or local government agencies) is not included in either intergovernmental or other revenue of the receiving government; the expenditures involved in granting such aid are included in direct expenditure of the granting government.

Besides intergovernmental aid "in kind," the following types of transactions between governments have not been isolated for special treatment as intergovernmental revenue or expenditure:

a. Contributions by local governments to State-administered retirement systems that cover their employees. These are included without distinction as part of the "current operation" expenditure of the local governments, and the receipts are included with State insurance trust revenue.

b. Interest paid or received on obligations of one government held by another government.

c. Transactions in which governments deal as ordinary suppliers and customers—e.g., in purchasing property, utility services, or supplies from one another.

Direct expenditure comprises all expenditure other than intergovernmental expenditure.

Since the data utilized for each individual government represent a consolidation of amounts from its various funds, payments between funds are eliminated for census reporting. Thus, a government employer contribution to a retirement fund it administers is not counted as expenditure, nor is the receipt of this contribution by the retirement fund considered revenue; only the payment out of the fund for retirement benefits is classified in the census tabulations as a governmental expenditure (in this particular illustration, an insurance trust expenditure).

The substantial amount of interest paid by the U.S. Treasury to the Federal insurance trust funds, which have all their reserves invested in Federal securities, is excluded from Federal interest expenditure and insurance trust revenue to avoid double counting in Federal financial aggregates. However, the principle of eliminating interfund transactions is not followed in the case of interest paid by a State or local government on any of its own securities held as an investment by insurance funds it administers—mainly because of the difficulty of identifying such transactions.

Y 505–566. Federal, State, and local government finances, 1902–1970.

Source: U.S. Bureau of the Census, 1902–1967, *Census of Governments, 1967*, vol. 6, No. 5, *Historical Statistics on Governmental Finances and Employment*; 1968–1970, *Governmental Finances in 1970–71*.

These data are a consolidation of data for the Federal Government in series Y 567–637 and for State and local governments in series Y 652–709. The amounts in these series are net of intergovernmental transactions between the Federal, State, and local governments.

Y 567–637. Federal Government finances, 1902–1970.

Source: See source for series Y 505–566.

The Bureau of the Census classification of Federal fiscal data was used in annual reports on *Governmental Finances* for the fiscal years 1952 through 1970. Derivation of the Federal Government data for earlier years is described on pp. 8–9 of *Historical Summary of Governmental Finances in the United States* (*Census of Governments: 1967*, vol. IV, No. 3).

The classification used by the Bureau of the Census for reporting State and local government finance statistics differs from the classification used in the U.S. Budget. Accordingly, it was necessary to recast U.S. Budget data. This involved not only (1) grouping of individual Federal receipt items and "budget expenditure" amounts for various agencies and appropriation items in accordance with the functional framework used for reporting of State and local government finances, but also (2) applying certain adjustments to Federal "budget receipts" and "budget expenditures" data in order to arrive at "revenue" and "expenditure" amounts, as reported here. These adjustments took account of the following major differences between these series:

(1) The financial transactions of government enterprises are included in Federal budget figures only to the extent of their net effect (plus or minus) upon budget expenditures; Census figures include gross revenue and expenditure of government enterprises (other than loan and investment transactions).

(2) Receipts from various enterprises or market-oriented Federal activities, from interest on loans the government has made, from sales of property or products, and from certain other reimbursements from non-Federal sources, as well as receipts from charges

for quarters and subsistence furnished to employees are treated in the Federal budget as offsets against expenditures and result in reducing Federal expenditure totals of related activities. For census purposes, these amounts are counted as revenue and added back to expenditure.

(3) Federal budget receipts and expenditures now include various financial transactions of trust funds which were excluded before fiscal 1967. Such transactions are included in census reporting of Federal revenue and expenditure, except for trust funds handled on an agency basis for State and local governments (e.g., the State accounts in the unemployment compensation fund, and District of Columbia funds).

(4) Although interfund and intragovernmental transactions are netted out of Federal budget totals, such transfer amounts are included in Federal figures for various receipts and expenditure categories. Census figures exclude such transfers.

(5) Federal budget expenditures include interest accrued but not paid during the fiscal year; census data on interest are on a disbursement basis.

(6) The net excess of loan disbursements or loan repayments of Federal loan accounts is added to expenditures or to receipts in developing budget totals. Such loan transactions are excluded from census reporting of Federal data.

In the 1967 Census of Governments reports, the introductory text includes detail for 1942–1967 for the census category, "National defense and international relations," showing how related items in Federal budget reports are regrouped in the Census of Governments classifications; and for 1902–1967, showing the census treatment of items grouped in Federal budget reports under "Veterans services and benefits." Other functional categories also differ from those shown for the Federal Government in series Y 335–471.

Federal Government indebtedness and the change in debt outstanding (series Y 601–604) correspond with "public debt" as reported by the U.S. Treasury. Consequently, series Y 601 is the same as series Y 493.

Y 638–651. Federal grants to State and local governments, 1930–1970.

Source: U.S. Social Security Administration, *Social Security Bulletin*, September 1971, p. 16. These series were compiled from the following Department of the Treasury sources: *Annual Report of the Secretary of the Treasury*, 1939–1940 and 1946–1970, supplemented by Federal agency published and unpublished reports; 1941–1945, *Annual Report of the Secretary of the Treasury, Combined Statement of Receipts, Expenditures, and Balances of the United States Government* and agency reports.

The definition of Federal grants used in compiling these series differs from that used by the Treasury Department. These data are confined to grants for cooperative Federal-State or Federal-local programs administered at the State and/or local level and to those programs in which the bulk of the funds is channeled through agencies of State and local governments. Emergency grants and the value of grants-in-kind, such as surplus foods distributed domestically or Braille materials for the blind, are included when they conform to these criteria. Shared revenues and payments in lieu of taxes are excluded from series Y 638–651 although included in the Treasury series, as are programs in which the States or localities act solely as agents of the Federal Government. Loans are excluded by definition.

The categories of grants (health, education, etc.) follow the organization of programs in the Social Security Administration's social welfare expenditures series, with the addition of the "Highways" and "All other" groups. "All other" grants are often presented with further breakdown of "Urban affairs," "Agriculture and natural resources," and "Miscellaneous" grants. A detailed list of the grants programs in each group can be found in the source annual as well as in the Federal grants article in the *Social Security Bulletin*, usually in the June issue.

Y 652–848. State and local government finances, 1902–1970.

Source: See source for series Y 505–566.

Periodic surveys of State and local government finance began in 1850; for that year and 1860 the data were published in conjunction with reports of the population census. For 1870–1922, the State and local government data were reported at approximately decennial intervals under the title, *Wealth, Debt, and Taxation*; for 1932, as *Financial Statistics of State and Local Governments*; and for 1942, 1957, 1962, and 1967, as the *Census of Governments*.

Census Bureau statistics on governmental finances, as initially published, have been broadly comparable within the three periods: Pre-1937, 1937 to 1950, and 1951 and subsequent years, but are less directly comparable from one period to another. The financial statistics shown here for 1950 and earlier years are substantially taken from several earlier studies, by which the statistics for particular years, as originally published, were recast and supplemented to derive comprehensive data in terms of the basic classification pattern which has applied since 1951.

For a summary discussion of the periodic censuses and annual Census Bureau reporting on governmental finances, see Census of Governments, 1967, vol. 6, No. 5: *Historical Statistics on Governmental Finances and Employment*, pp. 6–12. That report, and the similar "Historical" reports from the 1962 and 1957 censuses on governments present comparable nationwide data, by level of government, for selected years back to 1902, outline data classification changes, discuss the development of historically consistent data, and cite key source documents. They also provide combined State-local figures, by State, for selected years back to 1942.

For financial statistics of the individual State and local governments in 1967, see the detailed reports of the *Census of Governments, 1967*, especially vol. 4, presenting a separate bulletin for each State area.

For financial statistics in detail for the individual State governments, see the annual compilation by the Bureau of the Census, *State Government Finances*, issued for 1942–1957, as *Compendium of State Government Finances*; and for 1915–1941, as *Financial Statistics of States*. There were no volumes for 1920 and for 1932–1936; partial data were published for 1921; and data for 1932 were collected for 41 States but were not compiled fully or published.

Reports for earlier years used systems different from those applied since 1951. Figures for individual States on the later reporting basis are available in Bureau of the Census, *Revised Summary of State Government Finances, 1942–1950*, (State and Local Government Special Studies No. 32, 1953).

For detail for individual large city governments, and in many years for every city with population above 25,000 or 30,000, see the annual compilations published by the Department of Labor for 1898–1901 and by the Bureau of the Census for 1902–1941 (with gaps for the years 1914 and 1920), as *Financial Statistics of Cities* (with early variations in title), for 1942–1957, as *Compendium of City Government Finances*, and since 1957, as *City Government Finances*. Prior to 1932, the city statistics covered cities of 30,000 inhabitants or more in the preceding decennial census. For 1932–1941, coverage was limited to cities of 100,000 or more; for 1942–1959, the population minimum was 25,000; and beginning 1960, a 50,000 minimum has been applied. Since 1956, nationwide aggregates have been published annually, including sample-based estimates for the smaller municipalities.

A series on county governments also was published for 1943–1946, following the inclusion of all county governments in the Census of Governments for 1942. The county series yielded nationwide aggregates of county transactions and individual statistics for large counties.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Includes Federal civilian employees outside continental United States. Prior to 1953, figures are as of September 30.
[2] Local government data, except for 1967, 1962, and 1957, are subject to sampling variation.
[3] As of April 30.

Series Y 290–307. Government Monthly Payrolls, by Type of Government: 1940 to 1970

[In millions of dollars. For October except as noted]

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Federal payroll figures represent pay for the number of working days in month specified. Thus, changes in amount of payroll reflect in part differences in number of working days covered. Prior to 1953, data are for the month of September.
[2] Local government data, except for 1967, 1962, and 1957, are subject to sampling variation.
[3] Revised total figure; revised figures for detail not available.
[4] Data are for the month of April.
[5] Data are not available for any of the series for 1958–1961 and 1962–1963.

Series Y 308–317. Paid Civilian Employment of the Federal Government: 1816 to 1970

[As of June 30 except as noted]

NA Not available.

[1] Excludes employees of the Central Intelligence Agency and the National Security Agency.

[2] Data prior to June 1941 relate to District of Columbia only. Beginning July 1941, Alexandria city, Arlington County, and part of Fairfax County, Va. were added; parts of Montgomery and Prince Georges Counties, Md. were also added. Beginning 1950, all of Fairfax County, Va. and all of Montgomery and Prince Georges Counties, Md. are included. Beginning 1952, Falls Church city, Va. is included. Beginning 1965, Fairfax city, Va. is included. Beginning 1968, Loudoun and Prince William Counties, Va. are included.

[3] Prior to 1947, War and Navy Departments; beginning 1881, includes mechanics and other workmen at army arsenals and navy yards.

[4] Estimated for 1908–1928.

[5] As of July 31.

[6] As of Nov. 11.

[7] Jan. 16, 1886–June 30, 1887.

[8] Jan. 16, 1885–Jan. 15, 1886.

[9] Jan. 16, 1884–Jan. 15, 1885.

[10] July 16, 1883–Jan. 15, 1884.

Series Y 318–331. Paid Civilian Employment in Full-Time Positions in the Federal Government: 1948 to 1970

[As of June 30 except as noted. Excludes employees of Congress and Federal courts, maritime seamen of Department of Commerce, and small number for whom rates were not reported]

[1] In 1918–1924, railroads and other public utility corporations frequently reported only net income, resulting in understatements estimated at $5 billion in 1918 and 1919 and nearly twice that amount in 1920 and 1921; not estimated for 1922–1924.

[2] Excludes liquidating dividends.

[3] For 1941–1943, includes a small amount of surtax from returns with no net income but with partially tax-exempt interest from Government obligations. For 1941–1970, includes a small amount of tax from returns with no net income because of special provisions for insurance companies; for 1963–1970 includes tax from recomputing prior year investment credit; for 1967–1970, includes the surcharge; and for 1969–1970, includes the additional tax for tax preferences.

[4] Prior to 1927, included among those reporting no net income.

[5] The declared-value excess profits tax includes a small amount of tax from returns with no net income because the excess profits tax applied to interest on Government obligations exempt from income tax.

[6] Deficit.

[7] Gross income. "Total receipts" is not available separately for returns with net income and returns with no net income.

[8] Not tabulated.

[9] Amount of deficit for returns with no net income is not available.

Series Y 393–401. Individual Income Tax Returns: 1944 to 1970

[In thousands of dollars, except number of returns]

Income year	Number of returns			Returns with adjusted gross income				Returns with no adjusted gross income	
	Total	Taxable	Non-taxable [1]	Number	Adjusted gross income	Taxable income	Income tax (after credits)	Number [1]	Adjusted gross deficit

NA Not available.

[1] Includes fiduciary returns with net income filed on Form 1040, 1913–1936.

[2] For 1941–1943, total income on Form 1040A was also used as net income.

[3] Tax for 1924–1931, after earned income credit and capital loss credit; 1932–1933, after capital loss credit only; 1943, after foreign tax credit and tax paid at source. Tax for 1940–1941 includes defense tax and for 1943, victory tax.

[4] Somewhat understated because net income was used also as total income on returns with income of $1,000 to $2,000.

[5] Data pertain to last 10 months of year.

[1] Actual tax liability on selected net incomes and necessary assumptions.
[2] Includes income tax surcharge, generally 7.5 percent in 1968, 10 percent in 1969, and 2.5 percent in 1970, except in low tax brackets.
[3] Revenue Act of 1964.
[4] Internal Revenue Code of 1954.
[5] Excludes self-employment tax.
[6] Taking into account the following maximum effective rate limitations: For 1944–1945, 90 percent; 1946–1947, 85.5 percent; 1948–1949, 77 percent; 1950, 80 percent; 1951, 87.2 percent; 1952–1953, 88 percent; 1954–1957, 87 percent.
[7] Individual Income Tax Act of 1944.
[8] Tax liabilities unadjusted for transition to current payment basis.
[9] Includes net victory tax. Computed by assuming that deductions are 10 percent of victory tax net income; i.e., that victory tax net income is ten-ninths of selected net income.
[10] Includes defense tax.
[11] Rates and exemptions for 1936 and 1938 acts were identical and resulted in the same tax liabilities.
[12] Normal tax rates of 1928 act were reduced for 1929 only by Joint Resolution of Congress.
[13] Provisions of 1926 act were retroactive to 1925.
[14] Mar. 1, 1913–Dec. 31, 1915.
[15] Tax liability divided by stated net income.
[16] Split income basis.

NA Not available.
Z Less than $500.
[1] Effective Jan. 3, 1949, amounts refunded by the Government, principally for overpayment of taxes, are reported as deductions from total receipts rather than as outlays. Also, effective July 1, 1948, payments to the Treasury, principally by wholly owned Government corporations for retirement of capital stock and for disposition of earnings, are excluded in reporting both budget receipts and outlays. Neither change affects the budget surplus or deficit. Figures beginning with fiscal 1913 have been adjusted accordingly for comparability.
[2] Includes interest payments by Government corporations and other business-type activities on securities issued to the Treasury.
[3] Beginning 1954, undistributed intrabudgetary transactions are deducted from total. Beginning 1932, interfund transactions are deducted from total.
[4] Excludes education and training.
[5] Social Security trust fund outlays are reflected under the Department of the Treasury through fiscal 1962, and under the Department of Health, Education, and Welfare, thereafter.
[6] Includes military assistance.

Series Y 466–471. Outlays of the Federal Government, by Major Function: 1900 to 1939

[In millions of dollars. For years ending June 30]

Z Less than $500,000.

[1] Figures for 1791 through 1852 are not entirely comparable with later figures.

[2] Based on Bureau of the Census estimated population. Beginning 1959, estimates include Alaska and, 1960, Hawaii.

[3] Includes old demand notes; U.S. notes (gold reserve deducted since 1900); postal currency and fractional currency less the amounts officially estimated to have been destroyed; and also the deposits held by the Treasury for the retirement of Federal Reserve banknotes, and for national banknotes of national banks failed, in liquidation, and reducing circulation, which, prior to 1890, were not included in the published debt statements. Does not include gold, silver, or currency certificates, or Treasury notes of 1890 for redemption of which an exact equivalent of the respective kinds of money or bullion was held in the Treasury.

[4] Exclusive of bonds issued to Pacific Railways (provision was made by law to secure the Treasury against both principal and interest) and the Navy pension fund (which was not a debt, the principal being the property of the United States). The Statement of the Public Debt included the railroad bonds from issuance and the Navy fund from Sept. 1, 1896, until the Statement of June 30, 1890.

[5] Includes Treasury, Panama Canal, Depositary, and U.S. retirement plan bonds.

[6] Includes certificates of indebtedness. Also includes refunding certificates of deposit, 1880–1907, inclusive.

[7] Includes old Treasury (War) savings securities from 1918 through 1929.

[8] Comprises special issues to Government agencies and trust funds.

* Denotes first year for which figures include Alaska and Hawaii.
– Represents zero.
[1] To avoid duplication, transactions between governments are excluded; see text.
[2] Includes Alaska.
[3] Excludes interest on Federal securities held by Federal agencies and funds.
[4] Any State and local amounts for "Air and water transport and terminals" prior to 1951 are included under "Other and unallocable."

[1] Includes minor amounts of expenditure by municipalities on behalf of school districts, not shown separately. [2] Includes Alaska. [3] Minor amounts of intergovernmental expenditure to States not segregable from "Direct expenditure." [4] Washington, D.C., only.

Chapter Y

Armed Forces and Veterans (Series Y 849-1031)

Y 849–855. Estimates of total cost of U.S. wars.

Source: U.S. Congress, Joint Economic Committee, *The Military Budget and National Economic Priorities*, part I, pp. 149 and 150, 91st Congress, 1st session (statement of James L. Clayton, University of Utah, at Hearings before the Subcommittee on Economy in Government); and for series Y 853, U.S. Veterans Administration, *Annual Report of Administrator of Veterans Affairs*.

Details concerning individual estimates and the sources used by Professor Clayton are given in the source document.

An earlier study, *Cost of U.S. Wars* (typewritten form), was made by Raymond E. Manning, Senior Specialist in Taxation and Fiscal Policy, Legislative Reference Service, The Library of Congress, October 1956. This report gives details as to the period covered, the costs which are included and those excluded, and the assumptions and statistical method used for the computations for each war from the American Revolution through the Korean conflict.

Y 856–903. Selected characteristics of the Armed Forces, by war.

Source: The President's Commission on Veterans Pensions, *Veterans' Benefits in the United States*, vol. I; Staff Report No. IV, "Veterans in our Society," House Committee Print 261, 84th Cong., 2d session; and revised estimates prepared by the Department of Defense.

The time coverage for a particular war may vary from series to series. See source for exact coverage.

The number of personnel serving in the Revolutionary War is not known, but estimates range from 184,000 to 250,000. In the War of 1812, it is estimated that 286,730 served and in the Mexican War, 78,718. In the Civil War, estimates for Confederate forces range from 600,000 to 1,500,000.

Y 904–916. Military personnel on active duty, 1789–1970.

Source: U.S. Department of Defense, reports and unpublished data.

Primary sources of Army data are as follows: 1789, 1794, and 1795, *American State Papers, Military Affairs*, vol. 1 (except for officers, 1789, Thomas H. S. Hamersly, *Complete Regular Army Register of the United States for One Hundred Years (1779–1879)*, Washington, D.C., 1880); 1801–1821, *American State Papers, Military Affairs*, vol. 2; 1822–1939, *War Department Annual Reports* (except as follows: Regular Army, 1847 and 1866, Francis B. Heitman, *Historical Register and Dictionary of the United States Army*, vol. 2, Washington, D.C., 1903; Army Nurse Corps, 1920, Army field clerks, 1917, and Quartermaster Corps field clerks, 1917 and 1918, *Special Report 196*, Revised, Statistics Branch, War Department, General Staff, 1927; 1919 and 1920, Quartermaster Corps field clerks, *Regular Report 189*, Statistics Branch, War Department, General Staff, 1922; 1940–1957, Office of The Adjutant General, *Strength of the Army*, monthly reports. For data on U.S. Military Academy cadets, 1802–1821, *American State Papers, Military Affairs*, vol. 2; 1822–1920, *Official Register of the Officers and Cadets at the United States Military Academy* (except as follows: 1871, 1910, 1913, 1915, 1917, and 1918, *War Department Annual Reports*); 1921–1941, *War Department Annual Reports*; 1942–1970, *Strength of the Army*, monthly reports.

Some of the figures for the Navy and Marine Corps appear in the following sources: Gordon R. Young (ed.), *Army Almanac*, Stackpole Company, Harrisburg, Pennsylvania, 1959; Bureau of Navy Personnel, *Navy and Marine Corps, Military Personnel Statistics*, June and December 1956; Navy Department, Bureau of Personnel, *Progress Report*, March 1948.

Officers include warrant officers, flight officers, nurses, medical specialists, and field clerks. Enlisted personnel include U.S. Military Academy cadets, U.S. Naval Academy midshipmen, U.S. Air Force Academy cadets, and other officer candidates.

Army data (series Y 905–907) begin with 1789, the year in which the Department of War (now Department of the Army) was established. Although a "regular" Army has existed continuously from that time, the total strengths cannot be documented from available records, nor can reliable estimates be made for 1790–1793 and 1796–1800. Beginning 1861, the data include all military personnel on extended active duty with the Army (Regulars, volunteers, militia, inductees, Reserves, National Guardsmen, and reactivated retired Regular personnel) and U.S. Military Academy cadets. Data prior to 1861 are for Regular Army and cadets only, except for 1836–1840 (Seminole Indian War) and 1846–1848 (Mexican War). Source documents for other years do not contain adequate strength statistics on nonregular personnel called out during the War of 1812 or for short periods of service during the numerous Indian disturbances. For most years prior to 1878, data were compiled from the latest returns received; some of the reports used, especially those from the frontier garrisons, were weeks or months in transit.

The Army figures include the Army Nurse Corps beginning 1898; Army field clerks and field clerks in the Quartermaster Corps for 1917–1925; warrant officers beginning 1919; flight officers for 1943–1947; and the Women's Army Corps (formerly the Women's Army Auxiliary Corps) and the Women's Medical Specialist Corps (later redesignated the Army Medical Specialist Corps), beginning 1943. All data for these categories are as of June 30, except the 1898 figure for the Army Nurse Corps which is as of September 15.

The Army Nurse Corps became a part of the permanent Army military establishment in 1901. It traces its origin, however, to 1898, when authority was received to employ by contract as many nurses as needed during the war with Spain. For this reason, data on nurses have been included for 1898–1900.

The positions of Army field clerks and field clerks in the Quartermaster Corps were created by Act of Congress, August 29, 1916. Field clerks of both classes were subject to the rules and articles of war, and had the status of officers, although not commissioned officers. By Act of Congress, April 27, 1926, the Secretary of War was authorized and directed to appoint as warrant officers all field clerks then in active service.

The Army figures for 1908–1947 include strength of the Army Air Force and predecessor agencies. Those beginning with 1948 consist of military personnel under the command of the Army only, resulting from the establishment of the Department of the Air Force as an executive department by the National Security Act of 1947. Data for 1948 and 1949 include a small number of Department of the Air Force military personnel assigned for duty with Army commands, and data for 1948–1955 exclude a larger number of Department of the Army military personnel assigned for duty with Air Force commands.

Navy data for 1794, 1795, and 1798 are an approximation of the "on board" personnel authorized by Congress in conjunction with the construction of six frigates to reconstitute a Navy which had existed for 1775–1785 under the Continental Congress. A separate Navy Department was authorized and organized in 1798. Since the crews usually were obligated, during the early years of the Navy, for only a specific sailing or mission, rather than a continuous tour of duty, the strengths shown are more in the nature of averages and are therefore noted as estimated. Data exclude an unknown number of Naval Militia, supplied by the States, who served during the War of

1812, the Mexican War, and the Spanish-American War. Since 1916, naval reservist and retired personnel on extended active duty have been included.

The Marine Corps was founded in 1775 by the Continental Congress and served during the Revolutionary War, but ceased to exist in 1783. It was reactivated in 1794 when Congress authorized the building of the six frigates and a small number of marines were used as guards. The data in series Y 914–916 begin with 1798, since reliable estimates are not available for prior years. Since 1917, reservist and retired personnel on active duty have been included.

Y 917–926. Classification of selective service registrants, 1940–1970.

Source: U.S. Selective Service System. **Series 917,** 1940, *Selective Service in Peacetime,* Appendix 20. **Series 917–925,** 1941–1947, *Summary Reports of Classification, Continental United States, March 31, 1941–April 1, 1947,* vol. 1, parts 1–3; 1948–1950, *Statistics and Special Reports Digests, September 1948–September 1951,* U.S. Summary, vol. 1, part E; 1951–1952, *Statistics—Periodic Reports of Classifications, U.S. and State Summaries, October 1951–February 1956,* vol. II, part B, section 1, Regular Registrants; 1953–1970, compiled from Selective Service System Form 116. **Series 926,** 1940–1945, *Quotas, Calls, and Inductions,* Special Monograph No. 12, vol. II, Appendices F–H; 1946–1947, unpublished data; 1948–1970, compiled from Selective Service Form 262.

The Selective Service System is responsible for the registration, examination, classification, selection, and delivery for induction into the Armed Forces of all men required by law to register, or, in lieu of induction, for ordering them to perform civilian work. The law also provides exemptions or deferments from service for many persons for reasons of previous service, essential occupation, family dependency, etc.

The Selective Training and Service Act of 1940, which became law on September 16, 1940, was the first peacetime conscription law in U.S. history. The classification system under that Act provided for classification of registrants into four main groups in the order of their being called into the Armed Forces: Class I, persons available for training and service after the physical examination; Class II, persons available for training and service but temporarily deferred as necessary in defense industries for varying periods up to six months; Class III, persons who had dependents requiring their support; and Class IV, persons who were exempted from training and service by statute, or were nondeclarant aliens, or had completed military service (up to Pearl Harbor), or conscientious objectors against both combatant and noncombatant service, or who were physically, mentally, or morally unfit for service. Within these main classes there were certain subdivisions which indicated more specifically the status of the registrants.

For details concerning changes over time in legislation, classification, registration regulations, etc., see the annual and semiannual reports of the Director of the Selective Service System and the System's series of special monographs. A list of monographs covering the early years appears on the inside front cover of *Quotas, Calls, and Inductions,* cited in the source note.

Y 927–942. Disposition of defendants charged with violation of selective service acts, 1945–1970.

Source: U.S. Administrative Office of the U.S. Courts, *Federal Offenders in the United States District Courts, 1970,* table H10.

Statistics reflect defendants charged with violations of the Selective Training and Service Act of 1940 and the Universal Military Training and Service Act of 1948.

These data exclude District of Columbia, Canal Zone, Guam, and Virgin Islands.

Y 943–956. Estimated number of veterans in civil life, by age, 1865–1970.

Source: U.S. Veterans Administration, reports and unpublished data.

Age distribution for veterans of World War I, Spanish-American War, Civil War, Mexican War, and War of 1812 were obtained by procedures used in estimating the number of living veterans in civil life, as described in the text for series Y 957–970. The ages for veterans of Indian wars and Regular Establishment (peacetime service) were obtained from records of the Veterans Administration and predecessor agencies. Age distribution for Regular Establishment veterans is not included after 1965.

The ages of World War II veterans included in the total for 1945 were based on the ages of those veterans on the Veterans Administration disability compensation rolls on June 30, 1945. The estimated number of veterans by age, for 1950 and thereafter, were derived by the application of appropriate survival rates to the male and female components of the potential World War II veteran population as of July 25, 1947. In this particular case, the potential World War II veteran population is defined as: (a) The estimated number of men and women who had served in World War II and who had returned to civil life prior to July 25, 1947, and (b) those still in the service as of July 25, 1947. The age distribution of this population was derived from the Veterans Administration's sample of approximately 1 percent of the records of the men and women separated from the Armed Forces between September 16, 1940, and July 25, 1947, and from estimates provided by the Armed Forces for World War II participants who were still in service on the latter date.

The ages of Korean conflict veterans included for 1955 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life between June 27, 1950, and June 30, 1970.

The ages of veterans who served between the end of the Korean conflict and the inception of the Vietnam era included in 1966 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life in the period February 1, 1955, through August 4, 1964.

The ages of veterans who served in the Vietnam era included in 1966 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life between August 4, 1964, and June 30, 1970.

Y 957–970. Estimated number of veterans in civil life, by period of service, 1865–1970.

Source: U.S. Veterans Administration, reports and unpublished data.

The estimates for the War of 1812 were derived by a backward chain computation involving the application of appropriate survival rates to the age distribution of the 165 living veterans of this war on the pension rolls in 1892. It was assumed that all living veterans of the War of 1812 were on the pension rolls after 1873.

Estimates for the Mexican War were computed by applying appropriate survival rates to the age distribution of the 2,195 living Mexican War veterans on the pension rolls in 1907. For 1890 and later years, the estimates were based on the assumption that 90 percent of the living Mexican War veterans were on the pension rolls. Estimates for years prior to 1890 were based on a backward chain computation.

Estimates for the Indian wars include only veterans on pension rolls of the Veterans Administration or predecessor agencies.

The Civil War estimate for 1865 was based on Armed Forces data. Estimates for years after 1865 were computed from actuarial projections, based on the American Experience Mortality Table, 1868, applied to the age distribution of one million Civil War participants included in Surgeon General, *The Medical Department of the U.S. Army*

in the World War, vol. XV, *Statistics*, part I, 1921. The totals so obtained were modified by the assumptions that 75 percent of the living Civil War veterans were on the pension rolls in 1900–1915 and that practically all living Civil War veterans were on the rolls in 1920 and later years. The estimates pertain to Union forces only.

For the Spanish-American War, estimates for 1905 and later years were computed by application of appropriate survival rates to the 1902 age distribution of Spanish-American War participants (not shown here). For 1900, the estimate is based on total participants, inservice deaths, and discharges to civil life.

Estimates for World War I were computed by applying appropriate survival rates to the 1918 distribution of World War I participants by year of age based on records of 3.7 million War Risk Insurance applications (*The Medical Department of the U.S. Army . . .*, cited above).

For World War II, the Korean conflict, the Vietnam era, and service between the Korean conflict and Vietnam era, the estimates were derived from Armed Forces data on the number of persons returned to civil life less Veterans Administration estimates of deaths and less the number who reenlisted from civil life.

Data on the Regular Establishment include only former members of the peacetime forces receiving disability compensation or pension from the Veterans Administration or predecessor agencies.

The following periods are covered by the specified wars for determining veterans status:

War of 1812—June 18, 1812, through February 17, 1815
Mexican War—April 25, 1846, through May 30, 1848
Civil War—April 12, 1861, through April 13, 1865
Indian wars—1817 through 1898 (approximately)
Spanish-American War—April 21, 1898, through July 4, 1902 (includes the war with Spain, Boxer Rebellion, and Philippine Insurrection. For persons serving in the Moro Province, hostilities ended July 15, 1903)
World War I—April 6, 1917, through November 11, 1918 (for persons serving in Russia, the war ended April 1, 1920)
World War II—September 16, 1940, through July 25, 1947
Korean conflict—June 27, 1950, through January 31, 1955
Service between Korean conflict and Vietnam era—February 1, 1955, through August 4, 1964
Vietnam era—service after August 4, 1964

Y 971–983. Expenditures of Veterans Administration and predecessor agencies from appropriated funds, by period of service, 1790–1970.

Source: U.S. Veterans Administration. Original data are taken from annual reports of the Administrator of Veterans Affairs, Veterans Bureau, Bureau of Pensions, National Home for Disabled Volunteer Soldiers, and records of the Veterans Administration.

The data pertain to expenditures from appropriated funds (see text for series Y 984–997) for veterans and their dependents through June 30, 1970. Thus, they include expenditures for pensions since 1790 and for care in the National Homes (now Veterans Administration domiciliaries) since 1867. Grants-in-aid for the care of veterans in State homes were first made in 1889 and are included thereafter.

Expenditures on behalf of World War I veterans, made originally as allowances for the dependents of enlisted men in the Armed Forces, compensation for death and disability, medical care and treatment, vocational rehabilitation and training, and insurance against death or permanent disability, are included since October 1917. Subsequent adjustments of benefits for World War I veterans and for veterans of the earlier wars (e.g., extension of hospital benefits) are reflected in the ensuing years. Expenditures for World War II veterans began in 1941, and for veterans of the Korean conflict in 1951.

Trust and working fund expenditures (e.g., the U.S. Government Life and National Service Life Insurance Trust Funds, the Adjusted Service Certificate Trust Fund, and the General Post Fund) are excluded; transfers from appropriations to the insurance trust funds, however, are included. Also excluded are expenditures made by other Federal and State agencies (e.g., unemployment compensation paid to Korean conflict veterans by the Department of Labor, expenditures for retirement pay by the Department of Defense, and bonus payments made by State governments).

Of the $174.8 billion in total expenditures through 1970, $139.0 billion (79 percent) was directly allocated by war. The distribution of the remaining expenditures was estimated. Therefore, the figures are subject to a varying and unknown degree of error. For example, variations in average hospital costs between wars, or unusual administrative workloads are not reflected in the distribution factors used.

Y 984–997. Expenditures for veterans benefits and services by Veterans Administration and predecessor agencies, 1790–1970.

Source: U.S. Veterans Administration, *Annual Report of the Administrator of Veterans Affairs*, various issues, and unpublished data.

Data are based on checks paid through December 31, 1947, and on vouchers approved for payment thereafter. The data are gross, since they include expenditures made from amounts earned (in the form of reimbursements) by the various accounts. Expenditures from revolving funds are also gross, i.e., receipts have not been netted out of these funds except in minor instances noted elsewhere. Accordingly, these data do not agree with those reported in the statements of the Treasury Department and the Bureau of the Budget.

Y 984, total expenditures. This series measures the gross cost of benefits and services (including capital expenditures and administrative costs) provided veterans and their beneficiaries, irrespective of the source of funds. Included are expenditures from general and special funds appropriated by the Congress, revolving and management funds authorized to finance a continuing cycle of operations using receipts derived from these operations, and trust funds held by the Government for the benefit of veterans and their beneficiaries. Transfers from appropriations to insurance trust funds, from which the actual expenditures are made, are not included in the total, in order to avoid duplication. Expenditures from the Veterans Administration Revolving Supply Fund, established July 1, 1954, also are excluded from the total, since these amounts generally duplicate expenditures made by Veterans Administration administrative appropriations for supplies, equipment, and certain services procured through the fund.

Y 985, compensation and pensions. Data represent total expenditures less refund of overpayments.

Y 986, insurance and servicemen's indemnities. Data include direct payments to beneficiaries from insurance appropriations, servicemen's indemnities, and benefits and dividends paid from insurance trust funds. Some noncash transactions (e.g., interest credited to dividends left on deposit) also are included as expenditures from the trust funds. Transfers from appropriations to the insurance trust funds, from which the benefit payments are made, are not included in these amounts. Beginning fiscal year 1949, the reporting of expenditures from the U.S. Government Life Insurance and National Service Life Insurance trust funds was changed from a net to a gross basis. This resulted in an understatement in varying amounts for prior years. The cumulative differences for the prior years between the net figures and what the figures would have been on a gross basis have been added in a lump sum to the 1948 figures. This adjustment amounted to $295,651,000.

Y 987, education and training. This series includes subsistence allowances, tuition, supplies, and equipment of veterans training under Public Law 346, education and training allowances to veterans training under Public Law 550, veterans and servicemen training under Public Law 89–358, and educational assistance for dependents and survivors of totally disabled or deceased veterans under Public Laws 634, 88–361, and 90–631.

Y 988, vocational rehabilitation. Data include subsistence allowances, tuition, supplies, and equipment of veterans training under Public Laws 16, 894, and 87-815, and vocational rehabilitation allowances for World War I veterans.

Y 989, unemployment and self-employment allowances. Includes allowances to World War II veterans to assist in their readjustment to civilian employment. Similar allowances paid to Korean conflict and Vietnam veterans by the Department of Labor are excluded.

Y 990, loan guaranty. Includes payments on defaulted loans, and the cost of property and securities acquired. The amounts are gross and do not reflect the cost of the loan guaranty program to the Government. Refunds and recoveries on claims paid returned to the general fund and deposits to the loan guaranty revolving fund amounted to $2.9 billion through June 30, 1970. Other losses of the program are subject to further recovery from the liquidation of securities and repayments by borrowers.

Y 991, direct loans. Includes direct mortgage loans and advances to veterans, interest expenses on capital borrowed from the U.S. Treasury, and other expenses (excluding Veterans Administration administrative expenses) of the direct loan program. Expenditures are gross and do not reflect the cost of this program to the Government. Through June 30, 1970, receipts paid into the direct loan fund amounted to $3.1 billion, bringing net expenditures to $108 million. This will be further reduced, as the program matures, by payments of interest and principal by borrowers.

Y 992, miscellaneous benefit payments. Includes statutory burial allowances; expenditures not classified as to purpose from the compensation and pensions appropriation; automobiles and other conveyances for disabled veterans; specially adapted homes for paraplegic veterans; payments to participants in the yellow fever experiments; military and naval family allowances of World War I veterans; marine and seamen's insurance in World War I; adjusted service compensation (World War I bonus); General Post Fund expenditures; withdrawals of the personal funds of patients held by the Veterans Administration as banker and funds due incompetent beneficiaries; soldiers' and sailors' civil relief; and the vocational rehabilitation revolving fund. These expenditures are gross with the exceptions of soldiers' and sailors' civil relief and the vocational rehabilitation revolving fund, which are on a net basis.

Y 993, medical, hospital, and domiciliary services. Figures include expenditures for hospital nursing bed care, and domiciliary care, out-patient medical and dental treatment, medical research, and related costs; appropriations to the Canteen Service Revolving Fund; and grants to the Republic of the Philippines for medical care and treatment of veterans. Beginning 1921, the data are estimated. Prior to July 1, 1879, the fiscal year of the National Home for Disabled Volunteer Soldiers ended on various dates. For this period, the data have been proportionately adjusted by the Veterans Administration to reflect expenditures for years ending June 30.

Y 994, hospital and domiciliary facilities. These data include expenditures for the construction and equipping of hospitals and domiciliary facilities, and major alterations, improvements, and repairs thereof; grants to the Republic of the Philippines for the construction and equipping of a hospital; grants for construction of State extended care facilities; expenditures from funds allotted under the National Recovery Act of 1933 and Public Works Administration Act of 1938; and $436,623,692 transferred to the Department of the Army, Corps of Engineers, for the construction of hospitals.

Y 995, administration and other benefits. Includes expenses for vocational counseling of veterans, beneficiary travel for certain programs, reporting allowances paid schools for certifying the attendance of veteran trainees, private laws for relief, and all administrative salaries and expenses.

Y 996–997, expenditures from general and special fund appropriations. Series Y 996 represents expenditures from appropriations made by the Congress to finance the general and ordinary operations of the Veterans Administration and predecessor agencies. The figures differ from amounts shown under total expenditures (series Y 984) after 1917 in that they do not include expenditures from trust funds, working funds, and deposit funds. Transfers from appropriations to insurance trust funds (series Y 997) are included in the figures for series Y 996.

Y 998–1009. Veterans pensions and compensation—number of veterans and expenditure, by type, 1866–1970.

Source: U.S. Veterans Administration, records. Data were compiled from various annual reports of the Administrator of Veterans Affairs, and of the Commissioner of Pensions.

The basic distinction between pension and compensation is that pension is a benefit payable for total and permanent disability or death which is not attributable to the veteran's military service. Compensation is payable for the disability or death resulting from injury or disease incurred in, or aggravated by, military service. In the series relating to death benefits, the number of veterans refers to the number of deceased veterans whose dependents are receiving benefits, rather than to the number of dependents in receipt of such benefits; the data on expenditures refer to the amount received by these dependents. In the disability cases, the data refer to the number of veterans, and the amount of money paid to these veterans in the form of retirement pay administered by the Veterans Administration or its predecessor agencies.

For 1866–1890, separate data are not available for the death and disability series. Likewise, information is not available which would permit a separation of the data on the pensions and compensation earned for military service prior to 1904. As a result, all data on veterans of the Spanish-American and earlier wars have been arbitrarily included in the pension series.

The compensation data refer (with the qualifications as noted above for the series on deaths) to the number of, or expenditures paid to, veterans of the Regular Establishment, World War I, World War II, the Korean conflict, and Vietnam. Data on these veterans were first included in 1904, 1918, 1942, 1951, and 1965, respectively.

Y 1010–1027. Patients receiving hospital or domiciliary care authorized by Veterans Administration, 1921–1970.

Source: U.S. Veterans Administration, *Annual Report of the Administrator of Veterans Affairs*, various issues, and unpublished data.

These data do not in all cases agree with information previously published in some of the earlier annual reports of the Veterans Administration. Revisions were made to adjust some of the data for earlier years for comparability with current data.

The data for admissions is by type of patient; through 1960 neurological patients were included with neuropsychiatric, thereafter with general. Tuberculosis patients are included with general.

The data for all veterans receiving hospital care (series Y 1014) and veterans with service-connected disabilities (series Y 1019) are identical prior to 1925. The act which made Veterans Administration hospital care available to veterans with nonservice-connected disability was passed in 1924, and it was not until 1925 that such patients were admitted to Veterans Administration hospitals.

Data for veterans receiving hospital care for service-connected disabilities (series Y 1019–1022) exclude those veterans with service-connected disabilities who are being treated for nonservice-connected ailments.

Series Y 1018 shows the number of nonveteran patients in Veterans Administration hospitals. This group of patients is made up for the most part of persons still in the military service who have not yet attained veteran status, and cases admitted to Veterans Administration hospitals for humanitarian reasons.

Domiciliary care was provided by the National Homes for Disabled Volunteer Soldiers through July 30, 1930; later, it was provided by other agencies. The number of veterans in State homes receiving domiciliary care (series Y 1025) is shown because the Veterans Administration contributes to the support of veterans cared for in approved State homes who would be eligible for admission to Veterans Administration domiciliaries.

Y 1028–1031. Government life insurance administered by Veterans Administration—number of policies, income received, and benefits paid, 1921–1970.

Source: U.S. Veterans Administration, *Annual Report of the Administrator of Veterans Affairs*, various issues, and unpublished data.

The U.S. Government, through the Veterans Administration, operates two life insurance programs for veterans and servicemen. The insurance program which had its origin in World War I is known as U.S. Government Life Insurance (USGLI); and the program which had its inception in 1940 is called National Service Life Insurance (NSLI). The administrative expenses of these programs are borne by the U.S. Government. All USGLI is participating (that is, entitled to dividends from any earnings). This program was closed to new issues effective April 25, 1951. All NSLI issued prior to April 25, 1951, with some minor exceptions, is participating and entitled to dividends. This type of insurance also was closed to new issues in 1951. Veterans separated from military service without a service-connected disability on or after April 25, 1951, and before January 1, 1957, could apply for nonparticipating NSLI on the 5-year nonconvertible term plan only. Conversion to permanent plans was made available in 1959. This insurance is known as Veterans Special Life Insurance.

Veterans separated with a service-connected disability on or after April 25, 1951, are eligible to apply, within one year after service-connection is established, for permanent plan or term policies. This insurance is known as service-disabled veterans insurance.

In 1964 Congress enacted legislation which provided for a limited reopening of NSLI for a period of one year beginning May 1, 1965, to qualifying disabled veterans. To qualify they must have been eligible to buy National Service Life Insurance between October 8, 1940, and January 1, 1957, and have had either (1) a service-connected disability or (2) a nonservice disability, or a combination of service and nonservice disabilities so serious that they could not obtain commercial insurance at the highest rates. This insurance is known as Veterans Reopened Insurance.

The maximum amount of all Government insurance for veterans is $10,000 on one life. Excluded from these series are data on the Servicemen's Indemnity program, which was in effect from June 27, 1950, to January 1, 1957. This program provided free life insurance in the amount of $10,000 (less any USGLI or NSLI in force) while in military service and for 120 days thereafter.

Income received (series Y 1030) includes: (1) Premiums received from policy holders for insurance and disability income benefits, including premiums waived because of disability, (2) advances from Congressional appropriations to the service-disabled veterans insurance fund, (3) interest on investments in U.S. Treasury Certificates of Indebtedness and in U.S. Treasury notes, (4) interest on policy loans and on premiums paid in arrears, (5) dividends credited to insureds or deposited to accumulate at interest, and (6) reimbursements from the U.S. Government as the Government's contribution for death and disability claims due to the extra hazards of military or naval service, for gratuitous insurance, and for other obligations.

Benefits paid (series Y 1031) include: (1) The actual cash payments to beneficiaries of deceased insureds, (2) cash payments to insureds under the total and permanent disability provisions of USGLI policies, (3) monthly income payments under total disability income provisions of USGLI and NSLI policies issued before April 25, 1951, (4) premiums waived for total disability, (5) cash surrender values paid on contracts surrendered, (6) payments on matured endowment policies, (7) dividends paid and dividends previously credited or left on deposit and later withdrawn, (8) interest added on dividend credits and deposits, (9) adjustments in policy liens, receivables, and overpayments waived, (10) transfers to U.S. Government in the Veterans Special Life Insurance program, and (11) administrative costs in the Veterans Reopened Insurance program.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States,*** beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract,*** see Appendix I in the ***Abstract.***

Series Y 849–855. Estimates of Total Cost of U.S. Wars

[In millions of dollars, except percent]

War	Estimated total war costs	Original war costs [1]	Veterans' benefits			Estimated interest payments on war loans	
			Total costs under present laws [2]	Percent of original war costs	Total costs to 1970	Total	Percent of original war costs
	849	850	851	852	853	854	855
Vietnam conflict [3]	352,000	110,000	[4] 220,000	[4] 200	2,461	[5] 22,000	[5] 20
Korean conflict	164,000	54,000	99,000	184	15,016	11,000	20
World War II	664,000	288,000	290,000	100	87,445	86,000	30
World War I	112,000	26,000	75,000	290	45,585	11,000	42
Spanish-American War	6,460	400	6,000	1,505	5,436	60	15
Civil War (Union only)	12,952	3,200	8,580	260	8,570	1,172	37
Mexican War	147	73	64	88	64	10	14
War of 1812	158	93	49	53	49	16	17
American Revolution	190	100	70	70	70	20	20

[1] Based on expenditures of Departments of the Army and Navy to World War I and major national security expenditures thereafter. Usually the figures begin with the year the war began but in all cases they extend one year beyond the end of the actual conflict.

[2] To World War I, estimates are based on Veterans Administration data. For World War I, World War II, and Korean conflict, estimates are those of the 1956 report of the President's Commission on Veterans' Pensions plus 25 percent (the increase in the average value of benefits since the Commission made its report).

[3] Estimates based on assumption that war would end by June 30, 1970 (except for veterans' benefit costs to 1970). Occupation costs not included. Background data:

	Bil. dol.
Original cost:	
a. Major national security expenditures for Vietnam conflict, 1965–70 fiscal years	108.5
b. Cost of supporting American personnel in South Vietnam, 1954–64, at $25,000 per man per year	1.5
Total	110.0
Veterans' benefits:	
Medium estimate, 200 percent of original cost	220.0
Interest on war debt:	
Medium estimate, 20 percent of original cost	22.0
Total, medium estimate	352.0

[4] Medium-level estimate of 200 percent (high, 300; low, 100) based on figures expressing relationship of veterans' benefits payments to original costs of other major U.S. wars.

[5] Medium-level estimate of 20 percent (high, 30; low, 10) based on figures showing interest payments on war loans as percentage of original costs of other major U.S. wars.

Series Y 856–903. Selected Characteristics of the Armed Forces, by War

Series No.	Characteristic	Civil War (Union forces only)	Spanish-American War	World War I	World War II	Korean conflict

– Represents zero.

[1] Includes sentences of more than 6 months which are to be followed by a term of probation (mixed sentences).

[2] Includes split sentences where a defendant receives a sentence on a one-count indictment of 6 months or less in a jail type institution, followed by a term of probation. Included in these figures are mixed sentences involving confinement for 6 months or less on one count, to be followed by a term of probation on one or more other counts.

Series Y 943–956. Estimated Number of Veterans in Civil Life, by Age: 1865 to 1970

[**In thousands.** As of June 30. Includes all veterans of the Vietnam era, service between Korean conflict and the Vietnam era, Korean conflict, World War II, World War I, Spanish-American War, Civil War, Mexican War, and War of 1812, as well as those veterans of the Indian wars and former members of the Regular Establishment (peacetime) who were on the benefit rolls of Veterans Administration or predecessor agencies. Veterans who served in 2 or more wars prior to the Korean conflict are included 2 or more times; veterans who served in both World War II and the Korean conflict, and in the Vietnam era, Korean conflict, and World War II are included only once]

Z Less than 500.

[1] Includes only veterans on the benefit rolls of the Veterans Administration or predecessor agencies.

[2] Includes veterans who served in both World War II and the Korean conflict.

[3] Public Law 89-358, March 3, 1966, conferred veteran status on all persons serving on active duty in the Armed Forces after January 31, 1955. Veterans with service between the Korean conflict and Vietnam era (February 1, 1955–August 4, 1964) and Vietnam era veterans (service after August 4, 1964) included in the total veteran count beginning June 1966.

[4] Veterans whose only service was on active duty between January 31, 1955, and August 5, 1964. Excludes men who served on active duty for training only.

[5] Service after August 4, 1964.

[6] Includes veterans who served in both the Vietnam era and the Korean conflict or World War II.

[7] Former members of Regular Establishment (peacetime) receiving disability compensation from the Veterans Administration or predecessor agencies. Beginning June 1966, Regular Establishment veterans are excluded from total veterans since they are for the most part included as veterans with service between the Korean conflict and Vietnam era or as veterans of a war period.

Series Y 971–983. Expenditures of Veterans Administration and Predecessor Agencies From Appropriated Funds, by Period of Service: 1790 to 1970

Z Less than $500.
[1] Largely includes payments from trust accounts.
[2] Detail does not add to total because of adjustments for overpayments collected and items written off as uncollectible under the readjustment benefits program.
[3] Data for 1970 are on an accrued expenditures basis. Prior year data based on nonaccrual basis.
[4] Credit.
[5] Includes adjustments for prior years; see text.
[6] Includes total payments to veterans and beneficiaries on adjusted service certificates.

[1] Series Y 998, Y 1000, and Y 1002 represent the number of deceased veterans whose dependents were receiving pension or compensation. Series Y 999, Y 1001, and Y 1003 represent the number of living veterans who were receiving pension, compensation, disability allowance, or retirement pay.

Series Y 1010–1027. Patients Receiving Hospital or Domiciliary Care Authorized by Veterans Administration: 1921 to 1970

[Includes beneficiaries admitted and cared for in Army, Navy, other Federal, State, and civil (contract) hospitals. Patients receiving hospital care: 1921–54 as of June 30; 1955–62 as of May 31; 1963–70 as of census date]

Chapter Z

Colonial and Pre-Federal Statistics

Z 1–615. General note.

It would have been possible to distribute these series for the colonial and pre-Federal period among the chapters covering each of the appropriate subject fields. It was felt, however, that a separate chapter especially organized to cover this period would be more valuable in itself and would also provide a more suitable, less-exacting context for the statistics, many of which are relatively roughhewn.

In the past, statistics for the colonial and pre-Federal period were largely dependent on compilations made during the 17th and 18th centuries by historians such as Whitworth and Macpherson. Present-day scholars, however, no longer rely solely upon such compilations. They are ferreting out statistical information from original records hitherto left unused in archives and reconstructing statistical series of their own from other sources. Several of the series presented here are appearing in print for the first time. Compilers of the new series are identified in the source citations.

The Public Records Office in London (sometimes hereafter abbreviated PRO) contains many collections of records which throw light on commerce between England and the colonies and to some extent on the development of agriculture and manufacturing in the colonies, particularly when considered with reference to the mercantilist laws passed by the mother country, as has been done here. The laws in question are cited at various points in the text below by reference to their regnal year and chapter numbers—for example, 5 Geo. II c 22 (the fifth year of the reign of King George II, chapter 22).

The collections in the Public Records Office in London, which are the original sources for many of the data presented here, are identified there by title and call numbers. For example, one collection is titled "American Inspector General's Ledgers" and is further identified as "PRO Customs 16/1." The most important of these collections or ledgers of imports and exports are the following: The English Inspector General's Ledgers (PRO Customs 3); the Scottish Inspector General's Ledgers (PRO Customs 14); the American Inspector General's Ledgers (PRO Customs 16/1); and the colonial naval office lists (usually found in C. O. 5).

The English, Scottish, and American Inspector Generals' Ledgers are conveniently arranged for statistical purposes, but are so voluminous that it is far more convenient to utilize contemporary tabulations drawn from them when such secondary sources are available. The lists kept by the naval officers of that period (for the purpose of helping to enforce the navigation laws) merely provide chronological data concerning the ships which entered and cleared port, together with their cargoes and destinations.

The task of using the naval office lists has in some instances been lightened by colonial newspapers, such as the *South Carolina Gazette*, which published data taken from customhouse records. Also of general assistance in the preparation of many series presented in this chapter are the compilations from naval office lists prepared by a Works Progress Administration project conducted at the University of California, entitled "Trade and Commerce of the English Colonies in America," and referred to below as WPA compilations.

Z 1–19. Estimated population of American Colonies, 1610–1780.

Source: Compiled by Stella H. Sutherland, Due West, South Carolina, chiefly from the following sources: B. J. Brawley, *A Short History of the American Negro*, MacMillan, 1913; Elizabeth Donnan (editor), *Documents Illustrative of the History of the Slave Trade to America*, 4 vols., Carnegie Institution of Washington, D.C., 1930–35; Evarts B. Greene and Virginia D. Harrington, *American Population Before the Federal Census of 1790*, Columbia University Press, New York, 1932; Stella H. Sutherland, *Population Distribution in Colonial America*, AMS Press, Inc., New York, 1966; E. R. Turner, "The Negro in Pennsylvania," *Prize Essays of the American Historical Association*, Washington, D.C., 1911; Bureau of the Census, *A Century of Population Growth*, 1909; Thomas J. Wertenbaker, *The Planters of Colonial Virginia*, Princeton, 1922; and George W. Williams, *The History of the Negro Race in America From 1619 to 1880*, 2 vols., New York, 1883. (Also, a wide variety of source material was consulted for general information.)

The original data were obtained from the reports of the colonial officials to the Lords Commissioners of Trade and Plantations. Not infrequently a census supplied sworn evidence of the number of inhabitants; for other reports, the militia or the tax lists or both were used, commonly accompanied by an estimate of the whole population as indicated by the rolls or lists. Estimates made by colonial officials and by other informed contemporaries who did not disclose the figures upon which their conclusions were based have occasionally been included in these series. However, such estimates were selected in accordance with the general pattern of population growth.

The ratio of the militia to the whole population was generally 1 to 5⅓, but there were many exceptions. In Massachusetts, it was 1 to 6 in 1751 and 1 to 4 in 1763; in Connecticut, 1 to 6 in 1722 and 1756 and 1 to 7 in 1749, 1761, and 1774; it was 1 to 6 in Virginia and 1 to 7 in South Carolina at various times. No generalization can safely be made as to the ratio borne by the northern polls and ratables and by the southern taxables and tithables to the whole population of the Colonies. In every Province the figure was different. In the North, it ranged from 1 to 4 to 1 to 5½; in Pennsylvania, it was 1 to 7 in the 1750's, but 1 to 5.8 was the more common figure; in Maryland and Virginia, where both male and female slaves appeared on the tax lists, the ratio was 1 to 3 or 3.5 in the 17th century and 1 to 2.4 or 2.6 in the 18th century. The North Carolina white taxables were multiplied by 4 and the Negro taxables by 2.

The figures for Negroes for the 17th century, which are doubtlessly too low, are largely estimates based upon references to purchase and sale, to laws governing slavery, and occasionally to reports of more or less exact numbers.

Z 20–23. Percent distribution of the white population, by nationality, 1790.

Source: American Council of Learned Societies, "Report of Committee on Linguistic and National Stocks in the Population of the United States" (based on studies by Howard F. Barker and Marcus L. Hansen), *Annual Report of the American Historical Association, 1931*, vol. I, Washington, D.C., 1932, p. 124.

Distribution was made primarily on the basis of family names. For explanation of methods used, see source.

Z 24–132. Population censuses taken in the colonies and States during the colonial and pre-Federal period, 1624-25 to 1786.

Source: Compiled by Robert C. Klove, U.S. Bureau of the Census, with the counsel of Stella Sutherland, chiefly from the following sources: Evarts B. Greene and Virginia D. Harrington, *American Population Before the Federal Census of 1790*, Columbia University Press, New York, 1932 (reprinted by Peter Smith, Gloucester, Mass., 1966) and W. S. Rossiter, *A Century of Population Growth, From the*

field gave guidance in drawing the sample in the pilot study for the Middle Colonies. Stephen E. Fienberg and F. Kinley Larntz, Jr., gave guidance in sample drawing for the other regions. Mr. Larntz guided the final execution of the sampling and development of the weighting procedures.

Wealth is estimated on the basis of a sample drawn from all estates probated in the Thirteen Colonies in 1774. To select the sample, every county then in existence was given a chance to be drawn proportionate to its total wealthholding population in 1774. Each county, or cluster of counties, drawn into the sample represents an equal stratum of living wealthholders. Wealthholders are defined to include all free adult males aged 21 and over, white and Negro, and 10 percent of all free adult females, chiefly widows, except no Negro females in the South. Slaves and indentured servants are not counted as wealthholders. Because of the sample design and weighting procedures followed, the combination of data from sample countries within a region yields an unbiased regional estimate of wealth of probated estates, and the regional estimates combined, except for the weakness of the New York data, yield an unbiased estimate for all Thirteen Colonies. The data for probated decedents are adjusted, through the weighting procedure, to the age structure of the living and to include an allowance for wealth of persons not probated, and hence to represent the larger statistical population of living wealthholders.

The counties included in the sample and numbers of probate cases for each are:

New England: Total 381. Connecticut: Litchfield 31, New Haven 37; Massachusetts: Essex 102, Hampshire 27, Plymouth 35, Suffolk 100, Worcester 49. *Middle Colonies:* Total 217. Pennsylvania: Northampton 21, Westmoreland 7, Philadelphia 135; New Jersey: Burlington 25; Delaware: Kent 29. *South:* Total 298. Maryland: Queen Anne 38, Anne Arundel 27; Virginia: Charlotte-Halifax 25, Southampton-Brunswick-Mecklenburg 23, Charlotte-Spotsylvania-Fairfax 30; North Carolina: Halifax 39, Orange 32; South Carolina: Charles Town District 87. In addition, 23 probate inventories from nine counties in New York, together with regional data for New England and Middle Colonies, serve to form an estimate for New York which is part of the Thirteen Colonies total but is not shown separately.

All the inventories probated in 1774 within the sampled counties or county-clusters are included, with a few exceptions. In Essex County, Massachusetts, there was a cut-off at 102 cases, taking all surnames alphabetically from A to part way through the P's. In several counties or county-clusters some cases randomly drawn from 1773 or 1775 were added to provide an adequate number of cases. In the then frontier county of Westmoreland, Pennsylvania, three cases for 1774, two for 1773, and two for 1775 are all that exist for those dates. For New York, the 23 cases used represent all the cases located that were probated in any year from 1772 through 1775 not only in the two sample counties of Suffolk and Albany but in any county in the province.

Data from each county or county-cluster received equal weight in its regional average, inasmuch as each represents an equal stratum of living wealthholders. The procedure means that the counties with larger numbers of cases do not dominate or bias their respective regional averages, yet that full use could be made of all the available cases. For the New York estimate, the 23 cases received 10 percent weight, the New England average 30 percent, and the Middle Colonies average 60 percent. The assumption here is that if more cases for New York had survived, they would have shown wealth resembling that found in the adjoining New England and Middle Colonies, somewhat more like the latter than the former. The Thirteen Colonies total gives each component regional average, including the estimate for New York, an importance in proportion to its 1774 living wealthholder population.

For all regions, data on portable physical wealth and on financial assets came from the probate inventories with occasional adjustments for data found in estate accounts. For New England, the inventories are also the source of data on land. In the other regions, land was usually not shown in the inventories. For the Middle Colonies, original data on land come from tax lists and, for the South, from deeds and land grants. Data on financial liabilities for New England come from documents filed with probate inventories or from accounts of estate administrators or executors; in the other regions they came from the estate accounts.

Average wealth of the nonprobate-type living (persons who, upon death, would probably not have their estates probated) is assumed to equal one-fourth the average wealth of age-adjusted probated (i.e., probate-type living) in New York, the Middle Colonies, and the South, but one-half in New England. The larger figure is used for New England because a higher proportion of the wealthholders there were not probated. The numbers of living wealthholders (of either probate-type or nonprobate-type) is estimated as follows: Thirteen Colonies total 434,835; New England 137,934; New York 45,128; Middle Colonies 98,448; South 153,325. The proportions of these wealthholders estimated to be of nonprobate-type are: New England 66 percent, New York 40, Middle Colonies 36, South 27.

The numbers of free capita used to construct this table, i.e., the total free population in 1774, men, women, and children, white and Negro, are estimated as follows: Thirteen Colonies total 1,820,019; New England 582,285; New York 180,116; Middle Colonies 405,033; South 652,585. These numbers are estimated to form the following proportions of the total population, free and nonfree: Thirteen Colonies total 77.3 percent; New England 95.8; New York 88.8; Middle Colonies 92.5; South 59.0. The total population figures were interpolated to 1774 on the basis of compound annual rates of population growth, separately for whites and for Negroes, from series Z 1–17 of the previous edition of this volume (U.S. Bureau of the Census, *Historical Statistics of the United States: Colonial Times to 1957*). The proportions of indentured whites and of free Negroes which underlie the figures on free population are estimated from secondary sources listed more fully in the first and last bibliography titles cited above. The underlying age structure of the living population, used for age adjustment from decedent to 1774 living wealthholders, is based on proportions of free whites in the 1800 census, modified slightly in the proportions of children. Complete population tables for 1774 will appear in *Wealth of the Colonies*, Columbia University Press, forthcoming.

Wealth figures in original documents were always stated in local pounds, shillings, and pence of the particular province, which were of varying values in relation to each other and to the English pound sterling. All local pounds have been reduced to equivalent pounds sterling, using as exchange rates the following numbers of local pounds and decimal equivalents thereof as equal to one pound sterling: Massachusetts and Connecticut 1.33; New York 1.79; Pennsylvania, New Jersey, and Delaware 1.70; Maryland common money 1.67, Maryland current money 1.33; Virginia 1.32; North Carolina 1.77; South Carolina 7.00.

Z 192–194. Agriculture censuses in Maine, Massachusetts, and New Jersey, 1784.

Source: Jedidiah Morse, *American Geography*, Boston, 1792, pp. 172 and 284.

It may be assumed that the limited information on agriculture presented in this table for Maine, Massachusetts, and New Jersey for 1784 was collected at the same time that the population was enumerated. Maine was a part of Massachusetts until it became a State in 1820. Other agricultural statistics of this type, except for a few estimates for parts of colonies, do not appear to exist for the colonial and pre-Federal period.

Data for calories per day, series Z 195, have been recalculated from those shown in *Historical Statistics . . . Colonial Times to 1957* and rounded to the nearest 100. Exact precision cannot be expected in reducing colonial data to modern caloric terms. Also, the totals might have been reduced before actual consumption by spoilage, human carelessness, and dishonesty, or increased by fish, game, and produce in season. Researchers interested in the subject should write to Professor Lawrence A. Harper, Department of History, University of California, Berkeley.

Z 213–226. Value of exports to and imports from England by American Colonies and States, 1697–1791.

Source: 1697–1773, Charles Whitworth, *State of the Trade of Great Britain in Its Imports and Exports Progressively from the Year 1697*, G. Robinson, London, 1776; 1774–1776, David Macpherson, *Annals of Commerce, Manufactures, Fisheries and Navigation*, vol. III, Mundell & Son, Edinburgh, 1805, pp. 564, 585, and 599; 1777–1791, compiled by Jacob M. Price, University of Michigan, from Public Record Office, London, B.T. 6/185 ff.106v–117v.

The English Inspector General's Ledgers (Public Records Office, London, Customs 2 and 3) provide the original source for these figures. Unfortunately, Whitworth's erroneous title has caused many to believe the figures relate to Britain rather than to England but otherwise his volume has much value. The source tables cover all countries and appear in two formats: One gives England's trade with any one country, annually; the other shows all the countries with which England traded each year. Those interested in studying broader trends will find value in the decennial averages in John, Lord Sheffield, *Observations on the Commerce of the American States*, 6th edition, London, 1784. G. N. Clark's *Guide to English Commercial Statistics, 1696–1782* (Royal Historical Society Guides and Handbooks, No. 1, London, 1938) provides a valuable history and analysis of the basic statistics and a useful appendix which has a chronological list of statistical material for 1663–1783 and specifies where the data may be found.

Users of this material should note the basis on which the values rest. Smuggling does not constitute a material factor during the years under consideration. However, other difficulties arise with respect to the question of the volume of exports and the value of all the trade. The repeal of the export duties on woolen manufactures in 1701 (11 W. III c 20) and of the remaining export duties in 1721 (Geo. II c 15) removed the penalty for false entries on exports, and some merchants overstated their quantity for reasons of real or fancied prestige—a practice which may have injected an element of error of about 4 percent (Clark, cited above, pp. 16, 27, and 35).

Another problem arose in determining the value of the merchandise imported as well as exported. The authorities of the early 18th century were greatly interested in the balance of trade and at first tried to ascertain the real commercial value of merchandise. However, the difficulties of doing so, and the increasing recognition that there were intangible elements which the records could not disclose, led to the abandonment of attempts to keep the values current by the end of the second decade of the 18th century.

The so-called "official values" became stereotyped between 1705 and 1721 (Clark, cited above, pp. 17–23), a fact which diminished their value for use in striking a balance of trade but increased their usefulness as a rough-and-ready index of the relative increase or decrease of the volume of trade.

This table has been revised from that published in the *Historical Statistics . . ., Colonial Times to 1957* volume to include figures for the years 1777–1791. Also, several figures have been corrected, as indicated by footnote 1. The source for these corrections is: John J. McCusker, "The Current Value of English Exports, 1697 to 1800," *William and Mary Quarterly*, Third Series, vol. XXVIII, No. 4, October 1971, p. 612, footnote 8.

See also general note for series Z 1–615.

Z 227–244. Value of exports to and imports from Scotland by American Colonies and States, 1740–1791.

Source: Compiled by Jacob M. Price, University of Michigan, from records as follows: 1740–1773, House of Lords Record Office, London, 20 Nov. 1775; 1774–1791, Public Record Office, London, B.T., 6/185 ff.188v–204.

Z 245–252. Value of exports to and imports from England by New York, 1751–1775.

Source: Virginia D. Harrington, *The New York Merchant on the Eve of the Revolution*, Columbia University Press, New York, 1935, p. 354 (copyright).

Z 253–265. Tonnage capacity of ships, 1769 and 1770, and value of exports and imports of American Colonies, 1769, by destination and origin.

Source: David Macpherson, cited above in source for series Z 213–226, vol. III, pp. 571–572.

The tonnage figures shown are those used commercially—not those computed when the Royal Navy was purchasing vessels (see text for series Z 266–285). The statistics given by Macpherson are substantially the same as those given in Public Records Office, London, Customs 16/1, except that Macpherson put the 1769 inward-bound tonnage data for Southern Europe in the West Indies column (and vice versa)—an error which has been corrected here.

The value figures for 1769 provide only a rough-and-ready index of the relationship among the different trades. Totals include figures for the Islands of Newfoundland, Bahama, and Bermuda (a factor which statistically makes only a minor difference). These data are based on the official valuations used in the customhouse which, according to Macpherson, considerably understate the true amount. This defect, however serious for some purposes, does not destroy the value of the figures for comparative purposes. Also, it must be remembered that the value figures exclude the intercolonial coastwise trade which the tonnage figures show to have been as large as any other.

See also series Z 213–226, which provide a broader and more representative base for studying the relative relationship of the Thirteen Colonies trade with England.

It should be noted that the use of these figures on volume of the traffic for the various trades for estimating the amount of shipping given full-time employment must allow for repeated voyages of the same vessel.

Z 266–285. Number and tonnage capacity of ships outward and inward bound, to and from 5 cities, by destination and origin, 1714–1772.

Source: Compiled by Lawrence A. Harper, University of California, from photographic copies of the naval office lists in the British Public Records Office (C. O. 5), except for: 1714–1717, Boston, and 1715–18, New York City, E. B. O'Callaghen, ed., *Documents Relative to the Colonial History of the State of New York*, vol. V, Weed, Parsons, and Company, Albany, 1855, p. 618; 1733 and 1734, Philadelphia, *Pennsylvania Gazette* for those years; 1752, Port Hampton, Francis C. Huntley, "The Seaborne Trade of Virginia in Mid-Eighteenth Century: Port Hampton," *Virginia Magazine of History and Biography*, vol. LIX, No. 3, July 1951, pp. 302–303; 1763 and 1764, New York, and 1765 and 1766, New York, Boston, and Philadelphia, see source for series Z 245–252, pp. 356–358; and 1768–1772, all ports, American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Where the classification in *Documents Relative to the Colonial History* . . . did not correspond to that used here, the necessary adjustments were made by reference to the Colonial Naval Office lists (PRO C. O. 5).

The colonial naval officers appointed to enforce the English navigation laws as well as the collectors appointed by the English Commissioners of Customs under the act of 1673 (25 Car. II c 7) were charged with reporting the entry and clearance of ships as well as their cargoes. Many of the copies of the naval office lists have survived from the 18th century. When they have not, records of the names and destinations of the ships (but not their tonnages) may be obtained from the shipping news in the colonial newspapers. Such data of entries and clearances provide the best rough-and-ready index of the course of trade and its relative volume.

Although the figures concerning the entry of goods such as molasses might be distorted by illicit trade, the severity of the penalty (forfeiture) for failure to enter one's ship and the difficulty of concealing the offense help to warrant the accuracy of ship entry figures. Tonnage figures, however, present a special problem. Ralph Davis in "Organization and Finance of the English Shipping Industry in the Late Seventeenth Century" (doctoral thesis, University of London, 1955) states (pp. 476–479) that *the tonnage* as calculated when the English Navy was contracting *for the purchase* of a vessel was 25 to 33 percent greater than the *conventional "tons burden"* recorded in the customhouse books. Since the "tons burden" figures for the same ship remain constant in the passbooks and customs entries during the span of time here involved (although not necessarily for all periods), the difference between this purchase tonnage and the conventional tonnage will ordinarily not affect use of the data shown here.

See also general note for series Z 1–615.

Z 286–290. Value of commodity exports and imports, earnings, and value of slaves imported into British North American Colonies, 1768–1772.

Source: James F. Shepherd and Gary M. Walton, *Shipping, Maritime Trade, and the Economic Development of Colonial North America*, Cambridge University Press, London, 1972, table 1 (copyright).

The regions used are defined as follows: *Northern Colonies*—Newfoundland, Quebec, and Nova Scotia; *New England*—New Hampshire, Massachusetts, Rhode Island, and Connecticut; *Middle Colonies*—New York, New Jersey, Pennsylvania, and Delaware; *Upper South*—Maryland and Virginia; and *Lower South*—North Carolina, South Carolina, and Georgia. Florida includes East and West Florida, and has been grouped with the Bahama and the Bermuda Islands principally because the overseas trade from these colonies was small relative to the other regions. The Northern Colonies are not listed under Africa because there was no trade between them.

The source for the commodity export and import data was the American Inspector-General's Ledgers (Great Britain, Public Records Office, Customs 16/1) except that imports from Great Britain were taken from the English and Scottish customs records for these years (Great Britain, Public Records Office, Customs 3 and Customs 14, respectively). Price data were taken from various sources. Commodity exports are estimated f.o.b. values and commodity imports are estimated c.i.f. values. Shipping earnings include earnings from exports on colonial-owned ships plus earnings of colonial-owned ships carrying imports since the imports are valued c.i.f. Shipping earnings of colonial-owned ships carrying goods between foreign ports were estimated to have averaged 13,000 pounds sterling annually during 1768–1772. This estimate is included in the totals of shipping earnings, but not in the earnings estimated for the various routes between overseas areas and the colonies. These earnings are allocated to the total shipping earnings of each region as follows in pounds sterling: New England, 6,000; Middle Colonies, 3,000; and the Southern Colonies, 3,000. (1,000 pounds sterling were lost in rounding.) Other invisible earnings include interest, insurance, and mercantile profits earned by colonial residents in their trade with overseas areas. Because of the likely small amounts involved, no estimates were made for Africa. The source contains a discussion of the problems and procedures of estimation and the validity of the estimates.

Other items which affected the colonial balance of payments but which are not reflected in the estimates are the sale of ships to overseas residents, the immigration of indentured servants, and expenditures by the British government for civil government and defense in the colonies. The source also presents a discussion of the probable magnitudes of these items.

Z 291–293. Average annual coastal exports, imports, and balances of trade, by region, 1768–1772.

Source: James F. Shepherd and Samuel H. Williamson, "The Coastal Trade of the British North American Colonies, 1768–1772," *The Journal of Economic History*, XXXII, 4, December 1972, p. 798 (copyright).

The estimates of values for coastal exports from, and imports into, each colonial port district are based upon quantity data taken from the American Inspector-General's Ledgers (Great Britain, Public Records Office, Customs 16/1), and price data taken from various sources. The computed values were then aggregated according to the regional definitions specified in the text for series Z 286–290. It is important to note that these are *not* net exports from, or net imports into, each region. Exports and imports that took place between ports within each region, as well as those to or from other regions, are included in each regional total. Total export and import values should be approximately the same; the discrepancy is due principally to discrepancies in quantities recorded in the customs records.

See source for a discussion of the procedures of estimation and the validity of the estimates.

Z 294. Value and quantity of articles exported from British Continental Colonies, by destination, 1770.

Source: David Macpherson, cited above in source for series Z 213–226, vol. III, pp. 572–573, supplemented by American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Data do not include coastwise shipments as do the figures in the American Inspector General's Ledgers (PRO Customs 16/1). Macpherson (see source for series Z 213–226) states that he omitted fractional parts of the quantities but their value is retained in the value column. Because of this and an error which Macpherson saw but had no means of correcting, the value column may not be entirely

comparable with the quantity columns. The value figures are not the market values (which Macpherson believes to have been higher) but are the official customhouse values at the ports of exportation. Customs 16/1 presents the quantities in all cases for a longer time span, 1768–1772, but the data there are not so conveniently totaled as in Macpherson.

See also general note for series Z 1–615.

Z 295–304. Coal exported from James River ports in Virginia, by destination, 1758–1765.

Source: Howard N. Eavenson, *The First Century and a Quarter of American Coal Industry*, Waverly Press, Inc., Baltimore, 1942, pp. 32–34, and WPA compilations (see general note for series Z 1–615) of naval office lists at the University of California.

These figures were compiled from the colonial naval office lists by Eavenson. They represent only the years for which records are complete in the case of both the Upper and Lower James. Comparison with the colonial exports for 1768–1772 (compiled by Eavenson, p. 36, from PRO Customs 16/1) shows that the James River shipments constituted the great bulk of the exports from the Thirteen Colonies. Out of a total of 2,798 net tons recorded, 1,220 net tons were shipped from the Upper James, 180 from the Lower James, 1,100 from Nova Scotia, 117 from New Hampshire, and only minor quantities from other ports (which may have been used as ballast and originally may have come from Great Britain).

Chaldrons were not converted into tons at the Newcastle rate of 5,936 pounds equal to 2.97 net tons but on the measure used after the Revolutionary War, a chaldron equaling 36 bushels or 1.44 net tons.

Z 305–325. Coal imported, by American ports, 1768–1772.

Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Chaldrons and bushels were converted to net tons as described in text for series Z 295–304.

The WPA compilations (see general note for series Z 1–615) from the naval office lists show earlier entries of coal in the several ports, from time to time. The great bulk came from Britain, the remainder (except in the case of exports from James River ports) apparently were transshipments, but it is not until 1768 that records give a good cross section of the traffic.

Z 326–417. General note.

Iron was listed in colonial commerce as "pig iron" which derived its name from the shape assumed by the molten iron when poured from the furnace, after being separated from the ore, and "bar iron" which consisted of malleable iron produced in bloomeries or at the forge. Iron manufactures not specifically described by name, such as anchors, axes, pots, nails, scythes, etc., were listed as "cast iron" if poured into forms and "wrought iron" if forged from malleable iron, except in the English Inspector General's records (PRO Customs 3) where the term "wrought iron" seems to have included both cast and malleable iron products.

The statistical picture of iron in the colonies can be reconstructed in part from data concerning iron works in the colonies and in part from the records of colonial trade. The beginning of this industry came early in the various American colonies: Virginia 1622, Massachusetts 1645, Connecticut 1657, New Jersey 1680, Maryland 1715, Pennsylvania 1716, and New York shortly before 1750. By 1775, the colonies had at least 82 charcoal furnaces which produced about 300 tons each, or a total of 24,600 tons, of pig iron and more than 175 iron forges, some being bloomeries which made bar iron directly from the ore. Most of them, however, were refinery forges which used pig iron. Each of the 175 forges produced an average of 150 tons of bar iron a year, or 26,250 tons in all. In addition, there were slitting mills and other iron works.

Arthur C. Bining, in *British Regulation of the Colonial Iron Industry*, cited below for series Z 326–330, p. 134, provides a table comparing American production with the world total (see text table I). These estimates include pig iron, cast iron wares made at blast furnaces, and bar iron produced at bloomeries directly from the ore.

Table I. Iron Production of American Colonies and the World

[In tons]

Year	American Colonies	World
1800	45,000	400,000
1790	38,000	325,000
1775	30,000	210,000
1750	10,000	150,000
1700	1,500	100,000

The figures shown in series Z 326–417 for the movement of the various types of iron in commerce throw light on England's efforts to encourage Americans to produce pig and bar iron by freeing those products from import duties in England, and to limit further manufacture by prohibiting the erection of any new slitting or rolling mills, tilt hammer forges, or steel furnaces (23 Geo. II c 29; 30 Geo. II c 16). Iron was not added to the list of enumerated products which could be shipped only to Britain (or another colony) until 1764 (4 Geo. III c 15), and even then the law only forbade shipments to Europe.

Comparisons of colonial production with export figures will help provide estimates of the home market, which can be reduced to an approximate *per capita* base by reference to series Z 1–19.

See also general note for series Z 1–615.

Z 326–330. Pig iron exported to England, by colony, 1723–1776.

Source: 1723–1755, and **series Z 326** only, 1761–1776, Arthur Cecil Bining, *British Regulation of the Colonial Iron Industry*, University of Pennsylvania Press, Philadelphia, 1933, pp. 126–133 (copyright); 1756–1760, and **series Z 327–330**, 1761–1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Basically, all the figures come from the Inspector General's accounts although Bining obtained his from House of Lords manuscript, No. 185, and Harry Scrivenor, *Comprehensive History of the Iron Trade*, Longman, Brown, Green, and Longmans, London, 1841.

J. L. Bishop, *A History of American Manufactures . . .*, cited below for series Z 348–353, p. 625, gives an earlier figure when he states that the first iron sent to England from America was from Nevis and St. Christopher, followed in 1718 by 3⅓ tons from Virginia and Maryland. Series Z 326 is that of Bining and, where possible, footnotes explain the reasons for differences between his totals and those of the extended figures. The customs records were stated in terms of tons, hundredweights, quarters, and pounds, but they have here been rounded to tons.

Z 331–337. Pig iron exported from American Colonies, by destination and colony, 1768–1772.

Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

The difference in total exports given in series Z 331 for Great Britain and that in series Z 326 for England should reflect trade with Scotland except for the variation in terminal dates and the lapse of time required to cross the Atlantic. The trade, however, seems to have been minor. J. L. Bishop, *A History of American Manufactures . . .*, cited below for series Z 348–353, p. 628, gives figures showing that the pig iron exported to Scotland totaled only 264 tons in the 10 years from 1739 to 1749 and 229 tons in the 6 years from 1750 to 1756.

No figures are available for pig iron imported from England by the colonies. Such imports were probably negligible.

Z 338–347. Pig iron imported by American Colonies from other Continental Colonies, 1768–1772.

Source: See source for series Z 331–337.

In addition to the colonies shown, these series also cover New

Hampshire, New Jersey, Georgia, and Florida. However, these colonies imported no pig iron for 1768–1772.

Z 348–353. Bar iron imported from England by American Colonies, 1710–1750.

Source: 1710–1735, J. L. Bishop, *A History of American Manufactures From 1608 to 1860*, vol. I, Edward Young & Co., Philadelphia, 1861, p. 629; 1750, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Shipments of bar iron from England to the Colonies declined sharply in the last quarter century before the Revolution. Figures are not available for 1736–1749 to determine when the decline first became evident.

Imports were relatively few after 1750. The English and American Inspector Generals' Ledgers show that New England imported 6 tons in 1764, and again in 1769, and 1,053 bars in 1773. South Carolina imported 19 bars in 1770 and 3 hundredweight in 1773.

Z 354–359. Bar iron exported to England, by colony, 1718–1776.

Source: 1718–1755, and **series Z 354**, 1761–1776, Bining, cited above for series Z 326–330, pp. 128–133; 1756–1760, and **series Z 355–359**, 1761–1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

The original sources show data in tons, hundredweights, quarters, and pounds, but they have here been rounded by Lawrence A. Harper (University of California) to the nearest ton.

The source indicates that no bar iron was exported during 1710–1717 and for years which have been omitted in these series.

Z 360–373. Bar iron imported by American Colonies from other Continental Colonies, 1768–1772.

Source: See source for series Z 331–337.

Z 374–383. Bar iron exported by American Colonies, by destination and colony, 1768–1772.

Source: See source for series Z 331–337.

The difference in total exports given in series Z 374 for Great Britain and those in series Z 354 for England should reflect exports to Scotland, except for the variation in terminal dates and the lapse of time required to cross the Atlantic. According to J. L. Bishop, these exports were minor—only 11 tons from 1739 to 1749 (see text for series Z 331–337).

Z 384–397. Cast iron imported and exported by American Colonies, by origin and destination, 1768–1772.

Source: See source for series Z 331–337.

Additional information may be obtained concerning imports from England in the English Inspector General's Ledgers (PRO Customs 3) and in the WPA compilations (see general note for series Z 1–615) of the colonial naval office lists. English exports to the Colonies list, in addition to the generic heading "cast iron," such items as ordnance, iron pots, melting pots, and Flemish iron pots. The WPA compilations show an active coastal trade in pots as well as a surprisingly large quantity of sugar pots and sugar molds going to Kingston, Jamaica, especially from Philadelphia.

The figures for 1769–1771 may include some shipments from Scotland but the amounts probably are negligible.

The source also indicates additional minor quantities of cast iron exported to Southern Europe, Wine Islands, and West Indies.

Z 398–405. Wrought iron imported from England by American Colonies, 1710–1773.

Source: 1710–1735, Bishop, cited above for series Z 348–353, p. 629; 1750–1764, and 1773, English Inspector General's Ledgers, Public Records Office, London, Customs 3; 1769–1771, see source for series Z 331–337.

The figures for 1769–1771 may include some shipments from Scotland but the amounts probably are negligible.

The American Inspector General's figures for 1768–1772 (PRO Customs 16/1) disclose no exports of wrought iron from the Colonies to England, but the figures do show some shipments to the West Indies.

Z 406–417. Selected iron products imported and exported by American Colonies, 1768–1772.

Source: See source for series Z 331–337.

Figures are probably underestimated since the items included may have been listed under more general designations. The colonists were not necessarily dependent upon importation but may have manufactured their own nails and other articles from bar iron which was either home-produced or imported.

Since colonial imports of axes and scythes came so predominantly from the other colonies, and steel and nails from Great Britain, no note has been taken of the negligible importations of these items from other sources.

Z 418–431. Value of furs exported to England by British Continental Colonies, 1700–1775.

Source: Murray G. Lawson, "Fur—A Study in English Mercantilism, 1700–1775," *University of Toronto Studies*, History and Economics Series, vol. IX, University of Toronto Press, Toronto, 1943, pp. 108–109 (copyright).

As pointed out in the source, the fur trade is inextricably interwoven with the manufacture of beaver hats. Thus, the Hat Act of 1732 (5 Geo. II c 22) forbidding the exportation of hats by any colony, combined with the enumeration of beaver skins and furs in 1722 (8 Geo. I c 15), sought to protect the English hat manufacturers. These series show the importance to the English of their colonial supply of fur. Comparison of these figures with those shown in series Z 213–226 will demonstrate the relative unimportance of fur in the colonial balance of trade.

The source also specifies the different kinds and quantity of fur England imported from the colonies and elsewhere, as well as the quantity and value of the different markets of the world—data given in even greater detail in the original tables which Lawson has left with the WPA compilations at the University of California in Berkeley.

See also general note for series Z 1–615.

Z 432–435. Indigo and silk exported from South Carolina and Georgia, 1747–1788.

Source: **Series Z 432–434**, 1747–1775, Lewis C. Gray, *History of Agriculture in the Southern United States to 1860*, vol. II, Carnegie Institution of Washington, D.C., 1933, p. 1024 (copyright), (except 1766, WPA compilations of colonial naval office lists, Public Records Office, London, C. O. 5; and 1768–1772, photographic copies of the American Inspector General's Ledgers, Public Records Office, London, Customs 16/1); 1783–1788, compiled by Jacob M. Price, University of Michigan, from records of the Public Record Office, London B.T. 6/21 ff.311–312. **Series Z 435**, Lewis C. Gray, cited above, vol. I, p. 187.

See also general note for series Z 1–615.

The data on indigo are reasonably complete. Although South Carolina contemplated the production of indigo as early as 1672, little came of it, presumably because of the competition from the British West Indies. When the British Islands began to emphasize sugar rather than indigo, England had to depend upon the French West Indies for her supplies of indigo until South Carolina (thanks to the enterprise of Eliza Lucas) again entered the field. The first successful crop in 1744 was largely devoted to seed but South Carolina

was soon exporting in quantity. In due course, Georgia became a competitor but British Florida did not enter the picture until late. Even during the last 5 years of the colonial period, British Florida's production ranged only between 20,000 and 60,000 pounds (Gray, cited above, vol. I, pp. 54 and 291–295).

The great bulk of indigo went to Britain (which wanted it as a source of blue dye), not only because of its enumeration in the act of 1660 (12 Charles II c 18), but also because of the bounty England paid of 6 pence per pound (21 Charles II c 30). However, Customs 16/1 and the WPA compilations (see general note for series Z 1–615) show that minor quantities went to other Continental Colonies. Gray's Carolina figures, which were taken by him from an English source, apparently do not include coastwise shipments. This omission is relatively unimportant since the coastwise figures for 1768–1773 (as shown in Customs 16/1) represented only 1.6 percent of the total exports. The figures for Georgia (compiled by an American customs official) include shipments coastwise as well as to England—a matter of statistical significance as they constituted 5.1 percent of Georgia's total for 1768–1773.

Comparison of Gray's figures for 1747–1765 with those for 1768–1773 in Customs 16/1 suggests that Gray's figures are not for Charleston and Savannah alone, as shown by his headings, but for South Carolina and Georgia. In the case of South Carolina, the two series agree exactly in 1768, the one year when we have figures from both sources. Since Gray's source (British Museum, Kings Manuscripts, 206, f. 29) is the same for the earlier years, 1747–1765, it seems probable that the figures for these years also refer to South Carolina as a whole.

Customs 16/1 does not conclusively answer the problem in the case of Savannah. It shows for 1768–1772 that Savannah was the only Georgia port exporting indigo except in 1772. For this year, Gray's figures differ slightly from those shown in Customs 16/1 for Savannah alone and also those for Georgia as a whole. The decision to change the heading from Savannah to Georgia rests upon the fact that Bernard Romans (*A Concise Natural History of East and West Florida*, vol. I, New York, 1775, p. 104) specifies Georgia rather than Savannah.

Whether or not the figures are for Savannah or Georgia seems statistically insignificant. In South Carolina, however, ports other than Charleston provided 7.8 percent of that colony's exports to England for 1768–1773. Whatever may be true of Gray's figures, those given for 1768–1773 from Customs 16/1 do include all South Carolina ports and all of Georgia, but the only figure available for South Carolina for 1766 (from the WPA compilations) is for Charleston alone.

The figures on silk are from records compiled by the Georgia Comptroller of Customs (Gray, cited above, vol. I, p. 187). See also text for series Z 436–440.

Z 436–440. Silk exported and imported by North and South Carolina, 1731–1755.

Source: Chapman J. Milling, ed., *Colonial South Carolina*, University of South Carolina Press, Columbia, 1951, p. 104 (copyright).

Despite vigorous efforts to encourage colonial silk production by both British and colonial governments, more silk moved west than east across the Atlantic. Early figures gathered by Gray (cited above for series Z 432–435, vol. I, pp. 184–187) show that in 1654 Virginia reported the production of only 8 pounds; in 1656, 10 pounds (wound silk); in 1668, 300 pounds (sent to Charles II, type unspecified); in 1730, 300 pounds (raw), and that the Carolinas sent "several bales" to London in 1710 and again in 1716. Georgia's first efforts succeeded in sending only 20 pounds of silk to England in 1739. In 1741, she produced 600 pounds of cocoons (of which 16 pounds made 1 pound of silk) as against 37 pounds of wound silk in all the previous years of the colony. In 1749, the Salzburgers (a religious colony of industrious peasants and artisans) alone produced 762 pounds of cocoons and 50 pounds, 13 ounces, of spun silk. In 1764, the Colonies' total product amounted to 15,212 pounds of cocoons. See also text for series Z 432–435.

The figures for the Carolinas (1731–1755) were taken from British records and appear in Governor James Glen's *Description of South Carolina* (Milling, cited above, p. 104).

Z 441–472. General note.

Colonial statistics concerning production and consumption of tobacco have not been developed yet, and perhaps they can never advance beyond the rough estimate stage. For the present, only general deductions from export statistics and other evidence can be made.

Figures for trans-Atlantic shipments of tobacco in the 17th century leave much to be desired (see text for series Z 457–459) but those for the 18th century are reasonably satisfactory. The 18th century statistics of English imports rest upon contemporary compilations from customhouse entries. The figures for Scotland are less exact and in the early years they do not rise above mere estimates. However, Scotland's tobacco imports were relatively minor in those years. Fortunately, as their relative importance grew, the Scottish statistics became more reliable.

British imports represented virtually all the colonial exports. The figures given in series Z 441–448 and Z 449–456 give the landed weight in Britain. Due to the tobacco's loss of moisture while crossing the Atlantic, the landed weight in Britain is about 5 percent less than the shipping weight in America (Arthur P. Middleton, *Tobacco Coast*, the Mariners' Museum, Newport News, Va., 1953, p. 104; Rupert C. Jarvis, *Customs Letter-Books of the Port of Liverpool, 1711–1813*, the Chetham Society, Manchester, 1954).

Unfortunately, the English Inspector General's Ledgers of Imports and Exports (PRO Customs 3) do not differentiate between shipments from Virginia and Maryland as do the Scottish (PRO Customs 14) and the American (PRO Customs 16/1).

The validity of British statistics as a reflection of the American tobacco trade depends, of course, upon colonial obedience to the regulations requiring shipment (with minor exceptions) of colonial tobacco to England (Britain after 1707)—at first by royal order and after 1660 by the Navigation Act of 12 Car. II, c 18.

Until the English drove the Dutch from New Netherland (first in 1664 and finally in 1674) great opportunities existed for illicit trade in America. The rules also appear not to have been consistently enforced in Europe (see text for series Z 457–459). In the 1680's there was a flareup of illegal shipments to Ireland but it reflected a sudden change in the law. The offending vessels were apprehended and the great bulk of the Irish trade thereafter seems to have followed legal channels. There were lurid accounts of smuggling to Scotland at the turn of the century but the quantity of tobacco involved should be viewed in proportion to the trade as a whole. One cannot reasonably expect the illegal shipments at that time to exceed the shipments made a decade later with full sanction of the law. In fact, the illegal shipments presumably were much less because Scotland as a whole at the end of the 17th century had only one-fourth of the shipping it had within 5 years after direct trade was permitted. The Clyde ports, which were most concerned with the American trade, had only one-tenth of their later shipping (L. A. Harper, *The English Navigation Laws*, Columbia University Press, New York, 1939, pp. 260–261). In view of this difference in the shipping available, the volume of illegal trade would seem not to have been more than 250,000 pounds, and a comparison with series Z 441–448 shows that it represented at most 1 percent of the tobacco crossing the Atlantic lawfully.

During the 18th century there was undoubtedly some smuggling of tobacco but it does not seem likely to impair the validity of the colonial import statistics. The illicit trader's greatest profit did not lie in evading the provisions of the Navigation Act but in escaping the high taxes laid on tobacco in England. The most effective technique consisted in importing the tobacco and reexporting it legally to a nearby port (such as the Isle of Man) whence small craft could

First Census of the United States to the Twelfth: 1790–1900, U.S. Bureau of the Census, 1909.

The original data were obtained as follows:

Z 24–37, Connecticut.

1756 *Connecticut Colony Public Records*, XIV, p. 492. Rossiter has made corrections, p. 164. Greene and Harrington give the same figures as Rossiter, pp. 58–61.

1774 *Ibid.*, pp. 485–491. From Rossiter, pp. 166–169. Rossiter has made some corrections in addition from the original records. Greene and Harrington use the same source and give approximately the same figures but do not give as much detail, pp. 58–61.

1782 Jedidiah Morse, *American Geography*, Boston, 1792, pp. 217–218. From Greene and Harrington, p. 61.

Delaware.

	Total	*White*	*Negro*
1782	44,095	41,195	2,900

From unpublished manuscripts in the State House in Dover, Delaware, examined by Stella Sutherland. Only the census totals for Kent County (9,782) and Sussex County (12,660) are available. Newcastle County is missing, but Sutherland has estimated a total for Newcastle (21,153) which is included in the State total. She also made separate estimates for white and Negro.

Z 38–49, Maine.

1764–65 Josiah H. Benton, Jr., *Early Census Making in Massachusetts, 1643 to 1765*, Boston, 1905. With addition corrections by Rossiter, p. 162. Benton used the Crane MS (manuscript) for Massachusetts and Maine which was discovered about 1900. Greene and Harrington also preferred the Crane MS as published by Benton (see footnote a, pp. 21–22). Rossiter's figures are used in this table because they give more detail. The earlier Dana MS was published in Joseph B. Felt, "Statistics of the Population in Massachusetts" (in *American Statistical Association Collections*, I, 121–216), Boston, 1897. Felt does not include Negro and other persons and the total population is slightly less.

William D. Williamson, in *The History of the State of Maine, 1602–1820*, Hallowell, 1839, gives population for the three counties in Maine on p. 373 and also estimates for the plantations which were omitted in the enumeration. His source is the *Columbian Centinel* published in 1822 which, according to Greene and Harrington, was based on the Dana MS. His total is considerably larger and does indicate that the Dana MS included Negroes.

Z 50–62, Maryland.

1704 *Maryland Archives*, XXV, p. 256. From Greene and Harrington, p. 129.

1710 *Ibid.*, pp. 258–259. From Greene and Harrington, p. 129.

1712 *Ibid.*, p. 259. From Greene and Harrington, p. 129.

1755 *Gentleman's Magazine*, vol. XXXIV, p. 261. With corrections by Rossiter, p. 185. Rossiter gives more detail than Greene and Harrington, pp. 125–126, but the latter have some figures that vary considerably from those given by Rossiter. The total population is only 60 more. Greene and Harrington take their figures from a different source, *Maryland Records Miscellaneous*, 1755–75, 11 in Force, Transcripts (copied from Ezra Stiles' MS) in Library of Congress Transcripts.

1782 Jedidiah Morse, *American Geography*, Boston, 1792, p. 350. Also in Greene and Harrington, p. 127. Morse gives a partial breakdown of the totals and indicates that this census was taken by several assessors in March 1782.

Z 133–168. General note.

The two basic sources for the study of the colonial Negro are population statistics (see series Z 1–19 and Z 21–132) and commercial statistics concerning slave importations. Although direct knowledge of the colonial Negro's natural increase is scarce, available evidence indicates that this increase must have been considerable. It is reported in 1708 that about half of Boston's 400 Negro servants were born there, and Governor James Glen of South Carolina stated in 1749 that the number of Negroes in his colony increased rather than diminished during the nine years when prohibitive taxes and war "prevented any from being imported" (Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, Carnegie Institution of Washington, D.C., 1935, vols. III and IV, pp. 24 and 303, respectively). Otherwise, discrepancies between import and population figures (especially in later years) would call for the existence of an illegal trade in Negroes of an extent to which other evidence gives little support.

Donnan's *Documents . . .*, cited above, provides the greatest single source on the subject of the slave trade. She supplies references to many of the varied sources which provide such knowledge as we have of the 17th century, most helpful of which are the statistical reports prepared to help settle disputes between the Royal African Company and the separate traders.

After the first quarter of the 18th century, data on the slave trade usually rest upon the colonial naval office lists (PRO C. O. 5). Colonial newspapers sometimes reported the tallies which had been made in the customhouse; Donnan, *Documents . . .*, cited above, reproduces the individual entries for most of the lists which have survived, and the WPA compilations (see general note for series Z 1–615) give annual totals. In preparing the series on slaves, photographic copies of the naval office lists (PRO C. O. 5) were used when the Donnan entries and the WPA compilations did not agree. It is important to note, however, that the naval office lists report importations by sea rather than overland movements of slaves. Also, it is not always known how many of the Negroes survived after their entry was recorded. The Virginia statistics for 1710–1718 (Donnan, cited above, vol. IV, pp. 175–181) show that of 4,415 Negro slaves entered, 231 died within the time allowed to recover the duty and 103 were drawn back for exportation—7.5 percent of the total importations.

In the case of the Southern Colonies, the statistics for Virginia and South Carolina are reasonably complete; those for Maryland and Georgia are spotty; and those for North Carolina are virtually nonexistent.

In New England, the Negro population appears to have been due to natural increase rather than extensive importations. Governor Dudley of Massachusetts reported in 1708 that about one-half of Boston's Negro servants were born there (Donnan, cited above, vol. III, p. 24), and a comparison of the 1768–1773 trade figures, series Z 133–145, with the population figures, series Z 1–19, suggests that natural increase had become even more important than importations by the revolutionary era.

In the Middle Colonies the first Negroes were probably brought to New York from Spanish or Dutch prizes in 1625 or 1626. Dutch records are meager but show a consignment of 5 in 1660 and another of 300 in 1664. After the English conquest, New York for a time had an indeterminate trade in slaves with the pirates of Madagascar (Donnan, cited above, vol. III, pp. 405–406, 420, and 423). In Pennsylvania, the number of slaves was always small and their entry often discouraged by high taxes. Donnan (cited above, vol. III, pp. 408–409) believes that data about the slave trade there must be sought in merchant's account books, newspaper advertisements, and items of ship news, some of which appear in Edward R. Turner, "The Negro in Pennsylvania," *Prize Essays of American Historical Association*, Washington, D.C., 1911. In New Jersey, the slave trade centered in the eastern part of the colony, but here too the number of slaves imported was relatively small.

Z 133–145. Slave trade, by origin and destination, 1768–1772.

Source: Compiled by Lawrence A. Harper, University of California, from the American Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 16/1.

Z 146–149. Slave trade in Virginia, 1619–1767.

Source: 1619–1699, Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, Carnegie Institution of Washington, D.C., 1935, vol. IV, pp. 4–6, 49–65 (copyright), and Philip A. Bruce, *Economic History of Virginia in the Seventeenth Century*, vol. II, Macmillan, New York, 1895, pp. 66–85; 1700–1726, Donnan, *Documents Illustrative . . .*, vol. IV, pp. 173–187; 1727–1767, Donnan, vol. IV, pp. 187–234, and WPA compilations of colonial naval office lists (see general note for series Z 1–615).

The title of these series refers to "slaves" because that was the status of most Negroes listed, but it should be remembered that until the middle of the 17th century Negroes came as servants, not as slaves. Unless otherwise noted, these figures show the total trade at all Virginia ports. When one or more quarters of a port's naval office lists are missing, the total for the full year has been estimated, the calculations resting upon a chronological or geographic extension—whichever involved the least element of conjecture. The totals depend upon such estimates in all years after 1726 except 1737–1740, 1743–1745, 1750, 1758, 1761–1762, and 1764, when full records exist for all the ports except Accomack, which can be disregarded because of its lack of direct participation in the slave trade. No figure is given in which the total includes more than 20 percent estimate.

In the case of slaves exported, the highly variable nature of this trade did not warrant estimative totals. Of the slaves exported, 1,055 went to Maryland, 12 to North Carolina, 9 to Rhode Island, 8 and a shipment (number unspecified) to Barbados, 3 to Madeira, 2 to Great Britain, 2 to Georgia, and 1 to Boston.

Z 150–154. Slave trade in New York, 1701–1764.

Source: 1701–1718, E. B. O'Callaghan, ed., *Documents Relative to the Colonial History of the State of New York*, vol. V, Weed, Parsons & Co., Albany, 1855, p. 814; 1719–1764, Donnan, cited above for series Z 146–149, vol. III, pp. 462–509, and WPA compilations of colonial naval office lists (see general note for series Z 1–615).

Figures for New York for 1731 were partially estimated, for missing quarters, by Lawrence A. Harper, University of California. The estimates were derived by obtaining the ratio of the number of slaves imported for each quarter to the number annually imported. This ratio was based on figures covering a period of eight years in which quarterly data were available.

Figures for exports, 1701 to 1718, are not available.

Z 155–164. Slaves imported into Charleston, S.C., by origin, 1706–1775.

Source: Compiled by W. Robert Higgins, Murray State University, Murray, Kentucky.

The number of slaves from each source was obtained, unless otherwise designated, from the "Shipping Returns," and "Duty Books 'A,' 'B,' and 'C.'" The figures for 1717 to 1734 include all Negroes brought to South Carolina through the port of Charleston; for 1735 to 1775, the recorded number was of Negroes imported for sale. The number of cargoes was determined from information given in the same sources. The total number of slaves imported came from the same sources except for 1706 through 1724, which came from a report in 1737 by a committee of the South Carolina assembly containing a record of slave importations published in London. The number of cargoes for this period are from Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, vol. IV, p. 255.

The ports or locations from which the slaves were exported to Charleston are listed below:

From African ports—Anamaboe, Angola, Bance Island, Bonny, Calabar, Cape Coast, Cape Mount, Gambia, Gold Coast, Senegal, Sierra Leone, and Widah (Ouidah). By far the most frequent designation in the books was simply "Africa."

From Caribbean ports—Anguilla, Antigua, Bahamas (Providence), Barbados, Bermuda, Cuba (Havana, Oporto, Portola, Santa Cruz), Curacao, Dominica, Grenada and the Grenadines, Gaudeloupe, Haiti (including Cap Nicholas), Jamaica (including Spanish Town), Montserrat, Nevis, St. Christopher, St. Croix, St. Eustatius, St. Vincent, and Tobago.

From North American ports—Connecticut (New London), East Florida (St. Augustine), Georgia (Savannah), Massachusetts (Boston, Plymouth, and Salem), New Hampshire (Portsmouth), New York (New York city), North Carolina (Cape Fear), Pennsylvania (Philadelphia), Rhode Island, Virginia, and West Florida (Pensacola).

For further information see W. Robert Higgins, "The Geographical Origins of Negro Slaves in Colonial South Carolina," *The South Atlantic Quarterly*, vol. LXX, No. 1, Winter, 1971, or W. Robert Higgins, *The Slave Trade of Colonial South Carolina*, University of South Carolina Press, Columbia, South Carolina (forthcoming).

Z 165–168. British-American and West African slave prices, 1638–42 to 1773–75.

Source: Compiled by Richard N. Bean, University of Houston, from Richard N. Bean, *The British Transatlantic Slave Trade, 1650–1775*, unpublished Ph.D. dissertation, University of Washington, 1971, and Richard N. Bean, *Additional Slave Prices*, University of Houston, Department of Economics, Working Paper Series 741, No. 4, 1974.

Because of the scarcity of data, Bean included in his series almost every available observation on slave prices in order to get a continuous series. The numbers presented here were gleaned from such sources as commercial correspondence, government archives, published document collections, monographs, and occasionally undocumented citations in secondary sources. Some prices are for actual large scale transactions while others are simply estimates by informed contemporaries. Bean found no reasonable method to weight the observations according to their quality. Instead, he relied on the central limits theorem, operating through five-year averaging, to lessen the effect of the measurement errors. Since many of the price observations are averages for unspecified numbers of slaves, no attempt was made to weight the transaction prices by the number of slaves involved. British-American slave prices are adjusted to eliminate the effect of differential transport costs from Africa to places other than Jamaica.

Bean has suggested that anyone wishing to review his sources and methods of deriving these prices borrow copies of his unpublished Ph.D. dissertation and the working paper through inter-library loans from the universities cited.

Z 169–191. Components of private wealth per free capita for the Thirteen Colonies, by region, 1774.

Source: Calculated by Alice Hanson Jones. See Jones' "Wealth Estimates for the American Middle Colonies, 1774," *Economic Development and Cultural Change*, vol. 18, no. 4, pt. 2, July 1970; "La fortune privée en Pennsylvanie, New Jersey, Delaware, 1774," *Annales: Économies, Sociétes, Civilisations*, vol. 24, no. 2, Paris, France, Armand Colin, Mars-Avril, 1969, pp. 235–249; "Wealth Estimates for the New England Colonies about 1770," *Journal of Economic History*, vol. 32, no. 1, March 1972, pp. 98–127; *Wealth of the Colonies on the Eve of the American Revolution*, Columbia University Press, New York (forthcoming) and *American Colonial Wealth: Documents and Methods*, Arno Press, Inc., New York (forthcoming). Jerome Corn-

"run" it ashore again duty-free (for details, see Jacob M. Price, *The Tobacco Trade and the Treasury, 1685–1733: British Mercantilism in its Fiscal Aspects*, unpublished doctoral dissertation, Harvard University, 1954).

American historians have pointed to the small amount of the "plantation duties" collected on intercolonial trade as evidence of the breakdown of the laws. If the American colonists consumed the 5 pounds per capita of the Bermudians in the early 18th century, the 2 pounds of the English at the beginning of the 18th century, or even their 1 pound per capita at the end of the 18th century (Alfred Rive, "The Consumption of Tobacco Since 1600," *Economic Journal Supplement, Economic History Series*, vol. I, Jan. 1926, p. 63; H. C. Wilkinson, *Bermuda in the Old Empire*, Oxford University Press, London, 1950, p. 14), the colonies would have provided a sizable market of 2,000,000 to 10,000,000 pounds at the time of the Revolution. But that is a figure which can and must be greatly discounted. In the first place, it should be cut in half because the Southern Colonies had about half the population and provided their own source of supply. Similarly, allowance must be made for tobacco produced in the Northern colonies. Pennsylvania, Delaware, New York, Rhode Island, Connecticut, and Massachusetts all at one time or another grew tobacco (George L. Beer, *The Origins of the British Colonial System, 1578–1660*, Macmillan, New York, 1908, p. 88; J. B. Killebrew, *Report on the Culture and Curing of Tobacco in the United States*, Department of the Interior, Census Office, Washington, D.C., 1884, pp. 147 and 237; Vertrees J. Wyckoff, *Tobacco Regulation in Colonial Maryland*, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 37, 38, and 65). Philadelphia, Lewes, and New Castle appear in the WPA compilations (see general note for series Z 1–615) as suppliers to other ports like New York and Boston. New York itself exported tobacco (and even more snuff) coastwise as well as to England, and the exports from New England continued large even into the 1750's. In the 1760's, Rhode Island tobacco crops provided surpluses sufficient to warrant shipping 200,000 pounds to Surinam, a colony in South America (James B. Hedges, *The Browns of Providence Plantations*, Harvard University Press, Cambridge, 1952, pp. 30–40).

It need not be assumed that the colonists were averse to violating the law. It may be that violations on a significant scale were not good business. The fact that the 200,000 pounds of Rhode Island tobacco sent to Surinam went there illegally means little. It was a type of tobacco not in general demand and constituted less than one-third of one percent of the annual legal trade.

Z 441–448. Tobacco imported by England, by origin, 1697–1775.

Source: Compiled by Jacob M. Price, University of Michigan.

The basic sources used by Price are the same as those used by him for his doctoral dissertation (see below).

The English Inspector General's Ledgers (PRO Customs 3), which are the original source of the data, distinguish between entries in London and in the rest of the Kingdom (the outports) but Price has combined them in the interest of saving space.

Z 449–456. American tobacco imported and reexported by Great Britain, 1697–1791.

Source: 1697–1775, Jacob M. Price, *The Tobacco Trade and the Treasury, 1685–1733: British Mercantilism in its Fiscal Aspects*, unpublished doctoral dissertation, Harvard University, 1954; 1783–1791, compiled by Jacob M. Price, University of Michigan.

The basic sources of the data for England in Price's doctoral dissertation were the Inspector General's Ledgers of Imports and Exports (PRO Customs 2 and 3) except as follows (see general note for series Z 1–615 for an explanation of the call numbers which follow): 1703–1722, from PRO CO 390/5/47; 1717–1722, confirmed in PRO T. 1/281/18, BM Add. MS. 33,038 fol. 159; 1722 (London import only), from PRO T 64/276B/327; 1763–1769 (import only), from PRO T. 64/276B/328; 1770–1773 (import only), from PRO T. 64/276B/332; 1770–1771 (export), from PRO T. 64/276/330; 1772, 1774–1775 (import and export), from PRO T. 17/1,3,4; 1773–1775 (export), from Adam Anderson, *An Historical and Chronological Deduction of the Origin of Commerce*, vol. IV, J. Walter, London, 1707–1709, p. 447; 1783–1791, PRO Customs 17/8–14.

For Scotland, Price's data came from the Scottish Ledgers of Imports and Exports (PRO Customs 14), except as follows: 1707–1711 (import and export), from PRO T. 1/39/29; 1715–1717 (import and export), from PRO CO 390/5/13; 1721–1724 (import and export), from PRO T. 1/282/23; 1725–1731, 1752–1754, 1763, 1769 (import and export), from PRO T. 36/13; 1738–1747 (import and export), from PRO T. 1/329 fol. 125.

Total imports and reexports for 1708–1731 and 1752–1754 were obtained by adding figures not strictly comparable with each other. Scottish imports and reexports for 1708–1717 are averages of estimates for several years.

Z 457–459. American tobacco imported by England, 1616–1695.

Source: 1616–1621, Vertrees J. Wyckoff, *Tobacco Regulation in Colonial Maryland*, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 20–36 (copyright); 1622–1631, Neville Williams, "England's Tobacco Trade in the Reign of Charles I," *The Virginia Magazine of History and Biography*, October 1957, pp. 403–449, Virginia Historical Society, Richmond (copyright); 1637–1640, Stanley Gray and V. J. Wyckoff, "The International Tobacco Trade in the Seventeenth Century," *Southern Economic Journal*, VII, July 1940, pp. 18–25, University of North Carolina, Chapel Hill (copyright); 1663–1695, compiled by J. M. Price from PRO CO 388/2 ff.7,13 (1663, 1669), outports for 1669 from Lonsdale MS, B. M. Sloane MS.1815 ff.34–7 (1683–1689), PRO T. 1/36/9 fo.50 (1689–1693), and Gray and Wyckoff, cited above (1672–1682); 1693–1695, House of Lords Record Office, parchment collection.

The figures here are not as satisfactory as those given in series Z 441–448 and Z 449–456. The total imports for 1686 and 1688 were obtained by adding figures not strictly comparable with each other. Imports of the outports (English ports other than London) for 1682–1688 are averages of estimates for several years. In a few instances the figures from Gray and Wyckoff include minor quantities of Spanish and Brazilian tobacco.

As indicated in the general note for series Z 441–472, the figures shown prior to the time when the Dutch were driven from New Netherland should not be relied upon too greatly. Rive (cited in source above, pp. 57–75) suggests that the doubling of the London import figures between 1637 and 1638 may have been due to better patrolling of the Channel. There is much evidence to show that the laws restricting tobacco importations to London and excluding Spanish tobacco were disregarded at least in part (Beer, cited above in general note for series Z 441–472, pp. 197 ff.; Williams, cited in source above, pp. 419–420; Wyckoff, cited in source above, pp. 32–34).

An alternate approach to studying the import figures is to consider the estimates of tobacco which might be produced or purchased. English proposals for limitations on tobacco importation included the following: 55,000 pounds in 1620; 200,000 pounds in 1625 and 1626; 250,000 pounds in 1627; 600,000 pounds in 1635; and 1,600,000 pounds in 1638 (Beer, cited above in general note for series Z 441–472, pp. 120, 138, 154, and 158). Virginia meantime wanted the King in 1628 to take at least 500,000 pounds annually and by 1639 sought to reduce the tobacco crop to 1,500,000 that year and 1,300,000 pounds for each of the next two years (Killebrew, cited above in general note for series Z 441–472, pp. 215–216).

Another weakness of the figures for these series lies in their failure to show which colonies supplied the tobacco; however, other data provide some opportunities to estimate the quantity which the various colonies contributed. Virginia and Bermuda ran neck and neck in 1620 at 50,000 to 55,000 pounds each. In 1628, Virginia's shipments were twice those of Bermuda, and thereafter Virginia drew far ahead (Beer, cited above in general note for series Z 441–472, p. 120; and

contained about 350 pounds, Francis Yonge, the collector at Charleston, gave the figure of 400 pounds for 1719–1721; a Savannah Rice Association study declared it to be 325 pounds for 1720–1729; a contemporary report in 1731 and Governor Glen of South Carolina in 1749 said the barrel contained 500 pounds, but other documents say that it was 500–600 pounds in 1763; "something over 600 pounds in 1768–1769"; 550 pounds for 1764–1772; and 540 pounds net in 1772. O. M. Dickerson, *The Navigation Acts and the American Revolution* (cited above in text for series Z 473–480, p. 59) states that the formula used by the customs service for converting barrels to hundredweight had each barrel containing 4½ hundredweight, or 504 pounds (but the records do not disclose when the formula was calculated nor how often it was revised).

Fortunately, an examination of the surviving official statistics enables one to obtain averages calculated on broad bases. The decennial totals for 1720–1729 and 1730–1739 (Gov. James Glen, cited above) give both the number of barrels and the total weight shipped, showing the average barrel to weigh 373 pounds during the first decade and 448 pounds during the second. Similarly, the naval office lists for 1756–1767, which record both the number of barrels and pound weights shipped to Southern Europe and the West Indies, give a weighted average of about 525 pounds each for some 20,000 barrels.

Comparisons of the number of barrels shipped to Britain from America with the weight recorded for the rice arriving there provide another means of estimating the average weight of the rice barrel. For present purposes, it can be assumed to have been 350 pounds until 1720, and then to have risen 10 pounds a year until 1730, when it remained at a plateau of 450 pounds until after 1740; then it began to ascend at the rate of 5 pounds a year until it reached its pre-Revolutionary peak of 525 pounds in 1755. It must be remembered, however, that the weight of the barrels might vary radically. New York's Naval Office list for 1764 shows one shipment averaging 183½ pounds a barrel and another 698 pounds.

Z 481–485. Rice exported from producing areas, 1698–1789.

Source: 1698–1774, compiled by Lawrence A. Harper, University of California, from references discussed below; 1783–1789, compiled by Jacob M. Price, University of Michigan.

These series attempt to provide a comprehensive statistical summary comparable to those available for the postcolonial period. Barrels have been converted to pounds on the bases described in the general note for series Z 481–499.

There was the problem of totaling the exports from the three South Carolina ports (Charleston, Beaufort-Port Royal, and Georgetown-Wynyaw) and those of Georgia. Shipments from other colonies can be considered as having originated in South Carolina and Georgia, except possibly those of North Carolina, and even in this case most of the exports probably went through South Carolina. In any event, North Carolina's exports are grouped with South Carolina's shipments in the English import figures, under the generic heading, "Carolinas." Shipments to Scotland seem to have been infrequent and insignificant until the French and Indian War (1754–1763).

The Charleston figures, with the exceptions noted below, are those compiled by Gayle (cited above in general note for series Z 481–499) from the *South Carolina Gazette*, although his figures for less than 12 months have been extended to full year bases for 1750, 1756, 1757, 1763, and 1767. For 1698–1724, the figures have been calculated on the assumption that all American rice imports recorded in the English Inspector General's Ledgers were equal to ⅞ of Charleston's total exports, as suggested in 1719 by Francis Yonge, the customs collector at Charleston, a conclusion corroborated by a comparison of the WPA compilations of Charleston exports with the English imports for 1717, 1718, 1719, and 1724, and by Edward Randolph's remark in 1700 that 1/10 of Charleston's exports went to the West Indies alone (Carroll, cited above in general note for series Z 481–499). For 1731, the figures come from the WPA compilations of the Charleston Naval Office list (see general note for series Z 1–615), and for 1734 and 1758, directly from the *South Carolina Gazette;* for 1765, from the *Charleston Year Book* (1880) as copied by Holmes (cited above in general note for series Z 481–499); for 1766, from photographic copies of the Charleston Naval Office list (PRO C. O. 5); for 1768–1772, from the American Inspector General's Ledgers (PRO Customs 16/1); for 1773 and 1774, from Gray (cited above for series Z 432–435, p. 1022), although his partial figure for 1773 has been extended to complete the year. The years terminate October 31 except 1698 (September 28); 1699–1724, 1731 (December 24); and 1768–1773 (January 4 of the following year).

Neither Beaufort-Port Royal nor Georgetown-Wynyaw (South Carolina) seem to have had much importance until 1732. Although the former had its first collector in 1729, there was a lapse of 2½ years before his successor took over (PRO AO 1/804/1038, AO 1/805/1039); and the latter appears to have had its first collector in June 1732 (*South Carolina Gazette*, June 24, 1732). Scattered naval office records show Georgetown exporting 385 barrels for the year 1734 and 509 for the first quarter in 1735; and Beaufort, 342 during the first half of 1736. In 1739, Georgetown exported 2,202 barrels and Beaufort, 2,165 barrels (broadside, cited above, general note for series Z 481–499), an approximate equality which also existed in the period 1768–1772 (PRO Customs 16/1). For lack of a better basis, their exports will be considered for present purposes to have been equal from 1733 to 1768, when exact figures are available and were used. In 1739, the exports of the two together equalled 6½ percent of South Carolina's exports—a percentage which dropped by 1769–1772 to 4.4 percent. Thus, from 1739 to 1768, the Beaufort and Georgetown contributions have been assumed to be 5 percent of the total South Carolina exports. A different formula was used for the years prior to 1739, when their percentage was growing from the 2½ percent which they enjoyed in 1734 (calculated by doubling the Georgetown figures which have survived for that year). On the necessarily arbitrary assumption that the rate of increase was uniform, the two ports each year from 1734 to 1739 added 0.7 percent to their share of South Carolina's exports. Extending the same formula backwards, their share of the Carolina total was 1.8 percent in 1733 and 1.1 percent in 1732.

Romans, cited above, general note for series Z 481–499, provides figures for Georgia for 1756–1767. A comparison of his figures for Georgia's total exports with those of receipts from Georgia in England (see series Z 493–499) for the decade 1756–1765 shows a ratio of one barrel exported for every 2.07 hundredweight received; and for 1740, 1742, 1750, and 1753–1755, the barrels shipped from Georgia have been computed in accordance with that formula, on the basis of English receipts (series Z 493–499). Figures for 1768–1772 come from PRO Customs 16/1. In 1773 and 1774, Georgia is assumed to have contributed 13.9 percent of the total exports, as it did from 1768 to 1772. Years end January 4 of the year following, except for the years for which figures are calculated, as noted above. For those years, no exact date can be assigned and the data are therefore not strictly comparable.

The figures for 1768–1772 provide the best basis for the later period, but for present purposes the 1768 list was not included in the basic calculations described above because it lacks data for coastwise exports; however, it provides the best base for estimating the imports for that year. All that need be assumed is that the ratio of the coastwise exports to the other exports was the same in 1768 as the average of the other four years.

The coastwise entries for 1769–1773 show both inward and outward entries. Thus, to avoid duplications in the Carolina and Georgia entries, only the net exports coastwise have been included. This adjustment cannot be made prior to 1769, but samples from the WPA compilations (see general note for series Z 1–615) indicate that it is very minor.

The data for the various colonies are shown here, not because the individual details are necessarily accurate, but in order that scholars possessing more complete information may adjust the figures wherever possible.

The object of presenting these series is to provide the best possible pattern of the over-all development. The errors in detail are as likely as not to offset one another. Except for 1713–1731, when the estimates of the size of the barrels varied radically, the totals shown here should be within 5 percent of the true figure.

Data for 1783–1789 were compiled from records of Public Record Office, London Board of Trade, 6/21 ff.311–312. Shipping seasons for the crops of these years were: 1789 (crop of 1788), no limiting dates given; 1788 (crop of 1787), November 30, 1787–November 22, 1788; 1787 (crop of 1786), November 23, 1786–November 30, 1787; 1786 (crop of 1785), November 19, 1785–November 23, 1786; 1785 (crop of 1784), December 3, 1784–November 19, 1785; 1784 (crop of 1783), November 12, 1783–December 3, 1784; and 1783 (crop of 1782), January 17, 1783–November 12, 1783.

Z 486–492. Rice exported from Charleston, S.C., by destination, 1717–1766.

Source: Compiled by J. R. House from the WPA compilations of naval office lists at the University of California, Berkeley (see general note for series Z 1–615).

The differences in totals here and in series Z 481–485 may result in part from the differences in year-ending dates, as shown in the tabular headnotes.

Z 493–499. Rice exported to England, by origin, 1698–1776.

Source: Compiled by Lawrence A. Harper, University of California, from English Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 3 (except 1727, from PRO T.64/276B/323).

A large proportion of the exported rice was reexported by England, not only to Northern but also to Southern Europe.

Z 500–503. Pitch, tar, and turpentine exported from Charleston, S.C., 1725–1774.

Source: 1725–1755, 1760–1764, 1767–1771, Charles J. Gayle, "The Nature and Volume of Exports from Charleston, 1724–1774," *The Proceedings of the South Carolina Historical Association*, Columbia, 1937, p. 31; 1756–1759, 1765, 1772–1774, *South Carolina Gazette*, Charleston, S.C., various issues.

The basic source for these series has been the *South Carolina Gazette*, which obtained the figures from the customhouse books and ran them as cumulative totals from November 1st of most years. The editorial policy of the *Gazette* was not consistent, however; it did not always list the same commodities each year, and sometimes it discontinued the cumulative totals before October 31st.

The WPA compilations (see general note for series Z 1–615) from the English copies of these same records (PRO C. O. 5) provide an alternate source for some years. They also distinguish in detail the destination of the various shipments.

Z 504–509. Timber and timber products exported from Charleston, S.C., and Savannah, Ga., 1754–1774.

Source: **Series Z 504–506**, 1754–1755, 1760–1764, 1767–1771, Gayle, cited above for series Z 500–503, p. 31; 1756–1759, 1765, 1772–1774, *South Carolina Gazette*, Charleston, S.C., various issues. **Series Z 507–509**, Oliver M. Dickerson, *The Navigation Acts and the American Revolution*, University of Pennsylvania Press, Philadelphia, 1951, pp. 26–27 (copyright).

The original figures for Savannah were compiled by the Comptroller at that port. For discussion of Charleston figures, see text for series Z 500–503.

Z 510–515. Number and tonnage of vessels built, by type, 1768–1773.

Source: Compiled by Jacob M. Price, University of Michigan, from George Chalmers, *Opinions On Interesting Subjects . . . Arising From American Independence*, London, 1784, p. 105.

Z 516–529. Vessels built in Thirteen Colonies and West Florida, 1769–1771.

Source: Compiled by Jacob M. Price, University of Michigan, from John, Lord Sheffield, *Observations On the Commerce of the American States*, 6th edition, London 1784, p. 96.

Z 530–533. Number of vessels engaged in whaling, and quantity and value of oil acquired, Nantucket, Mass., 1715–1789.

Source: 1715–1785, Obed Macy, *The History of Nantucket*, Hilliard, Gray & Co., Boston, 1835, pp. 54–55 and 232–233; 1787–1789, U.S. Congress, *American State Papers*, Class 4, "Commerce and Navigation" (two volumes), vol. I, Gales and Seaton, Washington, D.C., 1832, p. 16.

The figures shown on pp. 232–233 of the source are stated to be from the Massachusetts Historical Society's Collections. Those on pp. 54–55 cite no authority; however, the Macy family descended from the first settlers and Obed Macy's data, which are generally consistent with information from other sources, provide the best figures now available.

The development of whaling in Nantucket followed the process typical of all the colonies [Walter S. Tower, *A History of the American Whale Fishery* (publications of the University of Pennsylvania, series in Political Economy and Public Law, No. 20), Philadelphia, 1907]. The early settlers first processed drift whales, then they engaged in the offshore fisheries which probably reached their height at Nantucket in 1726 when 86 whales were taken (Alexander Starbuck, *The History of Nantucket*, C. E. Goodspeed & Co., Boston, 1924, p. 356). The first deep-sea venture occurred about 1712 when a strong wind blew an offshore vessel to sea where it caught a spermaceti whale (Macy, cited above, p. 36). By 1746, Nantucket whalers were making their way to Davis Straits and by 1774 they were sailing as far away as the coast of Brazil (Macy, cited above, p. 54).

The figures for Nantucket may be viewed in better perspective by noting that in 1730 the New England whaling fleet totaled 1,300 tons, and in 1763 that of Massachusetts consisted of 180 sailing vessels. (Raymond McFarland, *A History of the New England Fisheries*, D. Appleton and Company, New York, 1911, p. 86.) At the time of the Revolution, New England had 304 whalers totaling 27,840 tons out of an estimated American fleet of 360 vessels (Tower, cited above, p. 45; Starbuck, cited above, p. 176).

Z 534–538. State of the cod fishery of Massachusetts, 1765–1775.

Source: Stella H. Sutherland, *Population Distribution in Colonial America*, AMS Press, Inc., New York, 1966 (copyright). (The original source of the data is Timothy Pitkin, *A Statistical View of the Commerce of the United States*, p. 84.)

Dr. John J. McCusker, University of Maryland, in "Weights and Measures in the Colonial Sugar Trade: The Gallon and the Pound and Their International Equivalents," *William and Mary Quarterly*, Third Series, vol. XXX, No. 4, October 1973, pp. 605 and 606, has supplied the following information on the definition of "quintal":

> "The usual multiple of the pound was the *hundred*, called frequently the *quintal* and more fully the *hundredweight* (abbreviated *cwt.* or *Ct.* in eighteenth-century accounts). The hundredweight usually but not always equalled one hundred times the basic unit.
>
> "By the middle of the seventeenth century, the *great hundred* of 112 pounds had become established for the English sugar trade as the standard hundredweight in the mother country but not consistently in the colonies. The English colonists on the North American continent bought and sold sugar by the great or long hundredweight, yet used the short hundredweight of 100 pounds for tobacco and codfish, commodities for which the mother country employed the long hundredweight."

Z 539–550. Daily wages of selected types of workmen, by area, 1621–1781.

Source: 1621–1670 and 1776–1781, Richard B. Morris, *Government and Labor in Early America*, Octagon Books, New York, 1975 (copyright 1946, and new foreword copyright © 1975, by Richard B. Morris); 1710, Richard Walsh, *The Charleston Sons of Liberty*, University of South Carolina Press, Columbia, 1959 (copyright).

The figures do not represent actual payments, which may have been higher, but they represent what the lawmakers believed was the proper maximum wage rate. Figures are payments to master craftsmen; journeymen received less (for example, 20 pence instead of 2 shillings in 1641).

For New Haven there were two wage rates—one for the summer, which is shown in these series, and one for the winter. For each occupation the winter rate was 6 shillings less in 1640 and 4 shillings less in 1641. Apparently the lower rate for the winter was paid because of the shorter workday.

The legislative rates also throw light on other labor facts. When New Haven set the rate for mowers in 1640, correlation of the daily wage (2 s. 6 d.) with the rate for mowing an acre of fresh marsh shows that they considered it a day's work, although they believed that mowing a salt marsh would take longer and be worth 3 shillings. The next year they confessed the ratio was inadequate when they lowered the daily wages without board to 20 d. and raised the rate for mowing to 3 s. per acre for fresh marsh and 3 s. 6 d. for salt marsh (Morris, cited above, pp. 79–80).

For discussion of the working day, see text for series Z 551–556.

Z 551–556. Daily and monthly wages of agricultural laborers in Maryland, 1638–1676.

Source: Manfred Jonas, "Wages in Early Colonial Maryland," *Maryland Historical Magazine*, vol. LI, March 1956, pp. 27–38.

The source also gives additional information on the cost of living. Its basic data came from scattered items in the *Archives of Maryland* (a series of annual volumes published by the Maryland Historical Society, Baltimore).

In Maryland, during the first half of the 17th century, the working month seems to have extended from 23 to 25 days and the working day from 10 to 12 hours. The 3 winter months were generally not included within the terms of labor contracts. Persons hired by the day worked the same hours and did not get lodging, but received at least 2 meals at the job (Jonas, cited above, pp. 30 and 34–35). In the other colonies the working day was probably much the same. New Haven, for example, specified in 1640 that a day's work was from 10 to 12 hours in summer and 8 hours in winter (Morris, *Government and Labor . . .*, cited above for series Z 539–550, pp. 59, 79, and 84).

Z 557. Index of wholesale prices estimated for colonial and pre-Federal years, 1720–1789.

Source: U.S. Congress, *Hearings Before the Joint Economic Committee*, 86th Congress, 1st session, Part II, *Historical and Comparative Rates of Production, Productivity, and Prices* (statement presented by Ethel D. Hoover, U.S. Bureau of Labor Statistics).

This index (which extends to 1958 in the source) was obtained by combining and splicing index numbers constructed by various investigators for different markets, to approximate a continuous series. The annual indexes were calculated by working forward and backward from the selected base period, 1850–59. No adjustments were made to the original series for differences in coverage or in methods of calculation. However, when wholesale prices in two or more markets were combined, the necessary conversions to a common base period were made, and occasional estimates, as noted in other parts of the source, were used.

For this series, weighted combinations were made of the available index series for three major markets (Philadelphia, New York, and Charleston), except for the years prior to 1732 and the Revolutionary War years. For these years, the estimates were based on Philadelphia prices only. The weights used to combine markets were rough approximations, based chiefly on estimates of the population and trade for each area and on the representative character and adequacy of the available indexes.

Z 558–577. Average annual wholesale prices of selected commodities in Philadelphia, 1720–1775.

Source: Anne Bezanson, Robert D. Gray, and Miriam Hussey, *Prices in Colonial Pennsylvania*, University of Pennsylvania Press, Philadelphia, 1935, pp. 422–424 (copyright).

The primary source of the original data was the list of "prices current" which first appeared in 1719 in the *American Mercury* and which was continued in that and other newspapers. Gaps were usually filled by reference to merchants' account books and letterbooks (as discussed and listed in the source cited, pp. 3–5, 351–354, and 434–438). The annual averages were computed "by taking the arithmetic mean of the 12 average monthly prices in each year. When any monthly price was missing the available data were averaged quarterly and the annual figure derived from the quarterly averages. . . . In some cases it was necessary to estimate a quarterly price by averaging the last monthly quotation in the previous quarter with the first monthly quotation in the following quarter. No annual price was estimated completely. . . ."

The source volume was sponsored by the International Scientific Committee in Price History, as were a number of other studies of colonial prices drawn together in A. H. Cole, *Wholesale Commodity Prices in the United States: 1700–1861*, Harvard University Press, Cambridge, 1938. In addition to discussion and analyses of prices, this publication offers a statistical supplement of monthly prices for the principal commercial centers. The tables in it, however, rest primarily upon the Philadelphia prices until the 1750's. Prior to 1750, Boston has only two series, wheat and molasses, which begin in 1720. Although there are gaps in the data, Charleston has series for bread, corn, rice, rum, wine, molasses, and staves beginning 1732; sugar beginning 1744; beef, pork, and indigo in 1747; and coffee, leather, and lumber in 1749. New York has series for flour, bread, rice, sugar, salt, rum, and molasses beginning 1748; and for wheat, beef, and pork beginning 1749.

Price series for the following Philadelphia commodities are shown in the source (not included here because of space limitations): Brown bread, white bread, London loaf sugar, Pennsylvania loaf sugar, indigo, bar iron, pig iron, hogshead staves, pipe staves, turpentine, and gunpowder. In addition to the annual averages, the source contains average monthly prices and monthly and annual indexes (both arithmetic and geometric) of 20 commodities in Philadelphia.

The unit of measure of Madeira wine (pipe) consists of 110 gallons. Barrels, in the case of beef and pork, consist of 31.5 gallons and hundredweights equal 112 pounds, except for tobacco where it equals 100 pounds.

Z 578–582. Prices of Maryland tobacco, 1711–1775.

Source: Carville V. Earle, *The Evolution of a Tidewater Settlement System: All Hallow's Parish, Maryland, 1650–1783*, Ph.D. dissertation, University of Chicago, 1973.

The prices of tobacco are from the probate records, inventories and accounts of Anne Arundel and Prince Georges counties between 1711 and 1775. The year runs from January 1 to December 31. Each year contains at least eight prices; the mean annual average is presented here. The prices are in British sterling. Accompanying the price series is a list of exchange rates for converting Maryland current money to sterling. In the probate records, where the tobacco prices appear, the monies of account are varied Maryland currencies which are overvalued in relation to sterling. Exchange rates between one of these currencies, Maryland current money, and sterling are frequent, and these administered rates provide the data for the exchange rate series. For each year, the modal exchange rate is entered.

So long as tobacco prices are in current money, they may be converted to sterling with this series. One problem concerns the years 1772 and 1773 when current money exchanged at 33⅓ and 66⅔; accordingly, for these years, two exchange rates and two tobacco prices are shown. A second problem occurs in 1757 when no one exchange rate is predominant; therefore, the mean exchange rate is used in preference to the mode.

Z 583. Farm prices of Maryland tobacco, 1659–1710.

Source: Russell R. Menard, "Farm Prices of Maryland Tobacco, 1659 to 1710," *Maryland Historical Magazine*, LXVIII, 1973, pp. 80–85.

The series presents yearly means based on crop appraisals and other data found in all Maryland probate inventories filed between 1659 and 1710. Full documentation and a description of procedure is provided in the source.

Z 584. Farm prices of Chesapeake tobacco, 1618–1658.

Source: Russell R. Menard, "A Note on Chesapeake Tobacco Prices, 1618 to 1660," (forthcoming) *Virginia Magazine of History and Biography* (copyright).

The series presents yearly means of price quotations found in correspondence, accounts of sales, promotional literature, court records, official proclamations, and legislative acts. Price quotations for Chesapeake tobacco in Europe and prices that appear to be deliberate exaggeration or understatements of the actual price were excluded from the mean. The means are based on few observations: in no one year did the number exceed ten; in most only two or three prices were found.

See source for further documentation and description of procedures.

Z 585. Annual rate of exchange on London for Pennsylvania currency, 1720–1775.

Source: See source for series Z 558–577, p. 432.

This series is derived from data in papers of Pennsylvania merchants and the Minutes of the Provincial Council (1739), supplemented in some years by Victor S. Clark, *History of Manufactures in the United States, 1893–1928*, vol. III, Carnegie Institution of Washington, D.C., 1916–1949, pp. 361–362. Bezanson et al., in *Prices . . .*, cited above, p. 431, also give monthly rates of exchanges during the same period.

Z 586. Annual price of an ounce of silver at Boston, Mass., 1700–1749.

Source: A. H. Cole, *Wholesale Commodity Prices in the United States: 1700–1861*, Harvard University Press, Cambridge, 1938, p. 119 (copyright).

The original shilling prices were taken from the Suffolk files by A. M. Davis, *Currency and Banking in the Province of Massachusetts Bay*, vol. I, Macmillan, New York, 1901, pp. 368 and 370. Where more than one price was given for a year, the high and low figures were averaged to determine the price for that year.

Z 587–598. Partial list of bills of credit and Treasury notes issued by American Colonies, 1703–1775.

Source: B. U. Ratchford, *American State Debts*, Duke University Press, Durham, 1941, pp. 26–27 (copyright).

These series attempt to show the issues of bills of credit and treasury notes emitted by the Colonies between 1703 and 1775. The £82,000 in bills issued by Massachusetts between 1690 and 1702 are not included, nor are the issues of Georgia, which never had a large debt. Under the trustees, the principal circulating medium in Georgia was the "sola" bills, issued only in the original by the trustees. A total of £135,000 of these bills of exchange were issued but only £1,149 remained unredeemed in 1752. Thereafter, Georgia emitted at least two issues of bills: One of £3,000 in 1756 and one of £7,410 in 1761 (Ratchford, cited above, p. 19).

Ratchford concedes that the list may be incomplete and that many of the issues listed were not made at the time nor in the exact amount stated. Sometimes the law authorizing the issue constitutes the only evidence, and nothing indicates "how, when, or to what extent the issue was actually made."

The original source for 1737–1748 for Massachusetts is A. M. Davis, cited above in text for series Z 586. Davis expressed all issues in the terms of old tenor (the form of bills which existed in February 1737). Ratchford did not follow this procedure because he did not feel sufficiently acquainted with the circumstances in each case to make the conversion with assurance. For all other years, the data rest upon a variety of sources cited in the footnotes of Ratchford's first chapter, which provide a helpful bibliography for further reference.

The footnotes to these series indicate the principal purposes for which the larger issues were made. For years when several issues appeared for different purposes, the footnotes indicate the purpose for issuing the majority of the bills.

Z 599–610. Paper money outstanding in American Colonies, 1705–1775.

Source: See source for series Z 587–598, p. 28.

The original sources of the data are various monographs cited in Ratchford's first chapter. Unfortunately, the authors of these monographs did not always attempt to find or to make estimates themselves. Some of the estimates are those of legislative committees or public officials and, less frequently, of contemporary writers. Many of the estimates for 1739 and 1748 come from William Douglass whose work is discussed in Charles Bullock, Introduction, *Economic Studies of the American Economic Association*, vol. II, No. 1. Georgia did not warrant a separate series, the only estimate being one for £5,500 for 1761.

For approximately a fifth of the figures, the actual year of issuance differs from that indicated in this table by one or two years; for exact year of issuance, see source.

Z 611–615. Tax collections in America under the different revenue laws, 1765–1774.

Source: Oliver M. Dickerson, *The Navigation Acts and the American Revolution*, University of Pennsylvania Press, Philadelphia, 1951, p. 201 (copyright).

Tax records have long been an untapped source of economic data. Dickerson has gathered figures from the English Treasury Papers for both the revenues collected under the Navigation Act of 1673 (25 Car. II c 7) and the new revenue measures which followed the French and Indian War (1763). He estimates (p. 202) that seizures (often highly technical) under the new revenue program cost the Americans not less than £60,956 "exclusive of fees, direct plunder, and costs of defending suits in the admiralty courts."

[1] For 1660–1750, Maine counties included with Massachusetts. Maine was a part of Massachusetts until it became a separate State in 1820.
[2] One of the original 13 States.
[3] Admitted to statehood in 1791.
[4] Plymouth became a part of the Province of Massachusetts in 1691.
[5] Admitted to statehood in 1792.
[6] Admitted to statehood in 1796.
[7] Includes some Indians.
[8] Includes 20 Negroes.

Williams, cited in source above, pp. 421–449). Her production had risen from 20,000 pounds in 1619 and went on to 18,150,000 in 1688 and 18,295,000 pounds in 1704 (R. A. Brock, "A Succinct Account of Tobacco in Virginia, 1607–1790," in J. B. Killebrew, cited above in general note for series Z 441–472, p. 224). Bermuda's production increased to 500,000 pounds at the most in the 1680's (George L. Beer, *The Old Colonial System, 1660–1754*, vol. II, Macmillan, New York, 1912, p. 91). At the end of the century, Bermuda's exports to England became negligible, and by the first quarter of the 18th century Bermuda was importing from Virginia some of the 20,000 pounds consumed by her population, which was estimated at 3,600 whites and 5,000 slaves in the 1680's (H. C. Wilkinson, *Bermuda in the Old Empire*, Oxford University Press, London, 1950, p. 14).

The West Indies were said to have begun growing tobacco as early as 1625; by 1628, reports show the shipment of about 100,000 pounds, but by the middle of the century sugar began to take over as the predominant crop (Beer, *The Origins . . .*, cited above in general note for series Z 441–472, pp. 89–90).

Meanwhile Maryland, which probably had produced no more than 100,000 pounds annually by 1639 (Wyckoff, cited in source above, p. 49), so increased her output that she contributed about 36 percent of the combined Virginia-Maryland total in 1688—a percentage she approximated at the turn of the 17th century (Margaret Shove Morriss, *Colonial Trade of Maryland, 1689–1715*, Johns Hopkins University Studies in Historical and Political Science, Series XXXII, No. 3, Baltimore, 1914, pp. 31–36) and during the period 1768 to 1773 (see series Z 467–468).

In the Colonies further south, North Carolina was said to be growing about 2,000 hogsheads, or 1,000,000 pounds, of tobacco in the 1670's—an estimate which seems more generous than the subsequent pattern of exports justifies (Beer, *The Old Colonial System, 1660–1754*, cited above, vol. II, p. 195).

Z 460–472. American tobacco exported and imported, by origin and destination, 1768–1772.

Source: Compiled by Lawrence A. Harper, University of California, from American Inspector General's Ledger of Imports and Exports, Public Records Office, London, Customs 16/1.

Although they cover only a few years, these series provide the only known comprehensive data which permit a complete analysis of the pre-Revolutionary colonial tobacco trade.

In the source, some export figures for 1768 and 1770 for Virginia, North Carolina, and South Carolina were shown in hogsheads or barrels. When the weights of these units were not indicated, they were converted to pounds by Harper, by using the average weights of these units as reflected in the shipments to Great Britain from the respective colonies for 1768–1772.

Also, the source shows the South Carolina export to Great Britain for 1771 as 433 hogsheads totaling 40,333 pounds. This obviously is an erroneous ratio. Since the hogshead figure is more comparable to other data shown here than the pounds figure, the former is assumed to be correct. It has been converted to pounds in the same manner as the 1770 export figures mentioned above.

Z 473–480. Tea imported from England by American Colonies, 1761–1775.

Source: Compiled by Lawrence A. Harper, University of California, from the English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Figures for tea imports shown in the American Inspector General's Ledgers (PRO Customs 16/1) for 1768–1772 closely approximate those shown here for the corresponding years (O. M. Dickerson, *The Navigation Acts and the American Revolution*, University of Pennsylvania Press, Philadelphia, 1951, pp. 99–100).

Z 481–499. General note.

Information on rice in the colonial period is limited primarily to the material on the clean rice which entered commercial trading. Presumably, the weight of this rice bore approximately the same ratio to the rough rice of the plantation at that time as it does now, that is, 100/162. There are no known satisfactory statistics on rice production and only scattered data concerning domestic consumption. Lord Carteret told the Board of Trade in 1715 that South Carolina "spent in the country" one-third of the 3,000 tons of rice she was producing at that time. By the pre-Revolutionary period, comparison of total exports with net imports for 1769–1772 indicates that only 3 percent of total exports was consumed in the nonrice-producing colonies.

The basic sources of statistics on clean rice in commerce are the records of importations in the British Public Records Office kept by the English Inspector General of Imports and Exports (Customs 2 and 3, since 1696), by the Scottish Inspector General (Customs 14, since 1755), by the American Inspector General (Customs 16/1, 1768–1772), and the records kept by the colonial naval officers (supplemented by those kept by the deputies of the London Commissioners of Customs for the comparatively few instances when these records have survived).

Data from these basic sources appear in: Gray, *History of Agriculture . . .*, cited above for series Z 432–435, pp. 1020–1023; Francis Yonge, *A View of the Trade of South Carolina*, London, 1722; C. J. Gayle, "The Nature and Volume of Exports From Charleston, 1724–1774," *The Proceedings of the South Carolina Historical Association*, Columbia, 1937, pp. 30–31; G. K. Holmes, *Rice Crop of the United States, 1712–1911* (Circular 34, Department of Agriculture, Bureau of Statistics, 1912); Francis Yonge, *Narratives of the Proceedings of the People of South Carolina*, in B. R. Carroll, *Historical Collections of South Carolina*, vol. II, Harper & Bros., New York, 1836, p. 156; *The Case of the Province of South Carolina* (Carroll, vol. II, p. 265); Gov. James Glen, *Description of South Carolina* (Carroll, vol. II, p. 26); "An Account of Sundry Goods Imported and . . . Exported . . . From the First of November 1738 to the First of November 1739" (printed as a broadside by P. Timothy, Charleston, 1739), Bernard Romans, *Natural History of East and West Florida*, New York, 1775; and WPA compilations from the Charleston Naval Office lists (see general note for series Z 1–615).

Fortunately, the British records measure the quantities imported in hundredweights, but the American statistics usually give only the number of barrels and other containers exported. Where half-barrels were reported, the number was divided by two and the result included in the barrel totals.

Miscellaneous units in the American figures have been converted to barrels. The term "cask" has been considered synonymous with "barrel," following the usage of the American Inspector General's Accounts for 1768, but the remaining figures are rough approximations suggested by the weights of other commodities as given in M. Postlethwayt, *The Universal Dictionary of Trade and Commerce*, W. Strahan, London, 1774; J. H. Alexander, *Universal Dictionary of Weights and Measures*, D. Van Nostrand, New York, 1867, and the *Oxford English Dictionary*. A tierce has been considered to equal 1⅓ barrels; a hogshead, 2 barrels; a puncheon, 2⅔ barrels; a butt, 4 barrels; small barrels and small casks, ½ of a barrel; seroons, boxes, and bags, ⅖ of a barrel; kegs, ⅕; and bushels, ⅛. Colonial containers varied so greatly that these estimates seldom, if ever, represented the exact relationship. When discussing weights and measures for other uses, additional information should be obtained and corrections, as may be necessary, should be made in the formulas employed here. For present purposes, these maverick units constitute such a negligible part of the whole that errors in estimating their weight seem unlikely to exceed those involved in rounding.

The significant problem lies in determining the weight of the barrel, the principal unit. Holmes (cited above, p. 4) stated that it weighed 350 pounds in 1717; 400 pounds, 1718–1729; and 500 pounds, 1730–1788, but as Gray (cited above, vol. II, p. 1020) points out, these figures conflict with those given by others. Although Governor Johnson of South Carolina stated in 1719 that the average barrel

– Represents zero.

[1] Corrected total from Greene and Harrington, p. 61. Morse gives total of 202,877 including 39,388 males between the ages of 16 and 50 and 103,735 females.

[2] Includes Indians. [3] Includes 900 not distributed by sex.

[4] 24,020 total per Williamson with 23,685 whites and 332 Negroes. Also, 2,789 houses and 3,572 families, not including estimates for the plantations.

[5] Including 35,268 free males above 18 years of age.

[6] Including 27,626 under 8 years of age; 13,399 males and females 8 to 14 years of age; 16,246 males from 14 to 45 years of age; 13,832 females from 14 to 36 years of age; and 12,259 males above 45 years of age and females above 36 years of age.

[7] 153,565 per Greene and Harrington, p. 126.

[8] Including 1,048 hired or indented and 67 convicts.

[9] 24,141 per Greene and Harrington, p. 126.

[10] Including 412 hired or indented and 21 convicts.

[11] Including 3,576 hired or indented and 1,507 convicts.

[12] 9,007 per Greene and Harrington, p. 126.

[13] Past labor or cripples. [14] Including 35 clergy and 637 poor men.

[15] Including 1,824 hired or indented and 386 convicts. [16] Slaves.

[17] Masters, freemen, and servants. [18] Freewomen and servants.

[19] Reported as Negroes and slaves.

[20] 1,959 were slaves.

[21] Includes 9,736 Quakers and reported Quakers who are whites and distributed by sex and age. [22] Total includes 12 Indians who paid taxes.

[23] Includes 3,204 persons in Kings and Richmond counties not returned in detail. An "imperfect" census according to Rossiter.

[24] Total includes 125 over 60 years of age not distributed by sex or race.

[25] Including 464 mulattoes.

[26] Including 1,015 freemen, 1,362 militia, and 55 white servants.

[27] These figures cover Cumberland and Gloucester counties which were superseded after Vermont became a State. Vermont was enumerated in the New York Census of 1771. [28] Includes 21,712 tithables and 35,884 untithables.

[29] Includes 21,606 tithables and 36,434 untithables.

– Represents zero.
[1] Information lacking or too incomplete to calculate.
[2] Figures have been extended on basis of partial data.
[3] Annual average. Source also shows 72 Indian slaves imported; 231 slaves died and 103 drawn back for exportation during the 9 years.
[4] Number of headrights granted.
[5] Number of Negroes shipped, not those actually arrived.

– Represents zero.
[1] Total number of slaves imported is greater than sum of source of importation; detailed figures are incomplete for early years.
[2] Incomplete; records missing.
[3] A three year prohibition of external slave trade was in effect during 1766 to 1768.
[4] A prohibitively high duty on slave importation was in effect during 1719 to 1722 and 1741 to 1744.
[5] Totals for 1725 and 1726 were obtained from BPRO Transcripts, C.O. 5, p. 387, and Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, vol. IV, p. 267. Detailed figures for the source of importation for these years and earlier are missing.
[6] Data from the "Shipping Records" of the Naval Officer of Charleston.

191	Financial liabilities	14.2	12.2	10.6	18.8

– Represents zero. Z Less than 0.05 pound.

[1] Occasional adjustments from supplementary information in estate accounts were appropriately added to or subtracted from affected wealth subcategory when information was sufficiently specific. Where no breakdown of such an adjustment as "what the goods sold for more than appraised," in the Middle Colonies, it appears here. Also includes, for New England, several cases where no subdivision of "Personal estate" was shown on the probate inventory.

Series Z 192–194. Agriculture Censuses in Maine, Massachusetts, and New Jersey: 1784

State	Acres of improved land	Number of horses	Number of horned cattle
	192	193	194
Maine	165,810	5,448	49,006
Massachusetts	921,563	43,969	237,993
New Jersey	2,032,587	52,488	102,221

Series Z 195–212. Basic Weekly Diets in Britain and America: 1622 to 1790

[In pounds or gallons unless otherwise specified]

Year	Calories per day	Biscuits	Bread	Flour	Oatmeal	Peas	Rice	Cornmeal	Fish	Beef	Pork	Bacon	Cheese	Butter	Beer	Molasses	Rum	Other

Before 1861, majority of slaves in U.S.	3,400–4,100							1 peck			3½ or 3½							
About 1790, slaves on Washington's plantation	2,800							11.3	2.4									[1] 0.42
1780, French prisoners returned to France and English repatriates	3,100		7							7					3½			
1780, Continental Army ration	2,600–4,000		7 or 7					1¾		7 or 6⅛								
1776, Tory prisoners in Maryland	3,600–4,200		7 or 7			3 pts		1 qt		7 or 5¼						7 gills		[2] 7 gills
1775, Continental Army ration	3,000–5,400		7 or 7			[3] 3 pts		[4] 1 pt	7 or 7	or 5¼					1¾ or [63]/[100]			[5] ⅛
About 1770, convicts sent to Va., Md., and Carolinas from England	2,000		4⅔		1⅔	1				⅔	½		⅔			1¼ lb		[6] ⅓ gill
1761, British Army in Canada	3,300–3,800			7		3 pts	½			7 or 4				⅜				
1757, Va. Militia in the field	2,900			7														[1] 7
1755, Acadians sent to Md	1,400			5							1							
1747, English prisoners of French, at Quebec	1,800–2,300		7			[7] 1¾ pts			1⅛ or 3½ or 1¾						1⁴/₅			(8)
1744–1746, R. I. Armed Sloop	4,000		7			[3] 2 qts				4	2			1			7/16	
1735, Ga. trustees, diet for passengers	3,600		6⅛	2		1 pt			½	3[1]/₅	2			[1]/[10]	21 pts			[9] 2/5
First half of 18th century, Mass. Militia:																		
Post allowance	3,100		7			3½ pts					4⅔					[1]/6		
Marching allowance	2,700		7								7						7 gills	
First half of 18th century, Mass. privateers	4,600		7			1 qt		1 pt		3	4				7			
1676, Va. Militia	4,400	7								3½		3½	3½					
1638, Josslyn voyage to New England, immigrants	4,900		7		7/80 gal	1⅛ pts			1½	4⅞			¾	¼	7			(10)
1632, children's hospital at Norwich, England	2,700		6[9]/16							1⅛			1⅜	14½ oz	2[5]/16			[11] 3 pts
1622, British naval vessels [12]	5,300–6,200	7							1½	8			¾	⅜	7			
		7				2 pts			1½	4	2		¾	⅜	7			
		7				2 pts			1½	4		2	¾	⅜	7			

[1] Meat.
[2] Vinegar.
[3] Peas or beans.
[4] ½ pint of rice or 1 pint of cornmeal.
[5] Milk.
[6] Gin.
[7] With pork ration only.
[8] 10½ spoonfuls of oil, and 21 spoonfuls of vinegar, with fish only.
[9] Suet or plums.
[10] Vinegar and mustard; quantity unknown.
[11] Pottage.
[12] Sailors received 1 of the 3 different diets.

NA Not available.

[1] Ending date of year unknown. For Boston, figures given in source for trade with the remainder of Massachusetts do not follow pattern of other entries and are, therefore, not a component of total. Totals were not taken from source but represent sum of detail as shown in source.

[2] Annual averages for years ending June 23. For Boston, the sum of the detail does not equal the total shown since the total includes entries for unknown ports.

[3] For year ending January 4 of following year.

[1] Fractional quantities have been dropped; therefore, total may not equal sum of components.
[2] Information needed to provide totals is not available.
[3] Figure as given in source; components add to 81,602.
[4] Except for a few items where value is shown.
[5] Figures disagree with source used here (Macpherson); corrected to agree with sum of components and with original source (PRO Customs 16/1).
[6] Quantity in tons of beef and pork.

Series Z 295–304. Coal Exported From James River Ports in Virginia, by Destination: 1758 to 1765

[1] Imported from Great Britain.
[2] No listing.
[3] Plus 36 to West Indies.
[4] Plus, from Great Britain, 15 in 1771.
[5] Plus, from Great Britain, 129 bundles in 1771 and 46 bundles and 1 dozen in 1769.
[6] 30 dozen to West Indies.
[7] Wrought iron entry coastwise in source includes 43 cwt. of anchors which may not have been included in number of anchors. Also, 27 anchors were imported from Great Britain.
[8] Plus 1,993 casks in 1770 and 84 casks in 1769 from Great Britain and 102 barrels in 1770 from other colonies.
[9] Plus 4,030 bars, 12.5 faggots, and 36 long steel in 1770, and 1 bundle and 41 faggots in 1769.
[10] Includes 110 cwt. of anchors which also have been included in the number of anchors.
[11] Wrought iron entry coastwise included 363 cwt. of anchors which may not have been included in the number of anchors.
[12] Anchors only.
[13] 15 anchors to Africa. All the wrought iron entries this year consisted of anchors.
[14] In addition to coastwise exports listed under wrought iron, 1 anchor went to the West Indies.

NA Not available.
[1] Savannah, Ga., only.
[2] For Charleston, the only South Carolina port for which data are available; other South Carolina ports averaged 7.8 percent of the colony's totals for 1768–1773.
[3] 827 casks at 350 lb. each.
[4] For 6½ months ending Feb. 24.
[5] For 11 months ending Oct. 6.
[6] For year ending Nov. 11.
[7] Plus 302 casks and 5 boxes.
[8] Plus 196 casks.
[9] Plus 357 casks.
[10] From Oct. 31, 1767, to Sept. 8, 1768, Charleston exported 530,092 pounds of indigo.
[11] For 9½ months ending Jan. 5 of following year.
[12] For year ending Mar. 24 of following year.

Appendix:

Contributors to This Edition of Historical Statistics

[Listed below, by chapter and subject, are the names of persons other than those listed on pp. viii–x, who contributed new or revised data or text additions and revisions to this edition, to the extent they could be identified. In some cases, manuscript was provided for the book without specific identification of the persons engaged in its compilation, preparation, or review]

Subject	Contributor
Chapter N	
General review	Robert E. Lipsey, National Bureau of Economic Research, Inc.
Value of public and private construction	Dollie Finn, Bureau of the Census
Construction contracts awarded	Jonah Otelsberg, F. W. Dodge Corp.
Construction bidding volume	Linda Marcotte, Engineering News-Record
Railroad construction cost indexes	Edward P. Johnson, Interstate Commerce Commission
Wholesale price indexes, construction materials	David Slack, Bureau of Labor Statistics
Housing units, major Federal programs	H. G. Ries, Department of Housing and Urban Development
Low-rent public housing units	Robert E. Ryan, Department of Housing and Urban Development
Nonfarm residential mortgage debt	David F. Seiders, Board of Governors of the Federal Reserve System
Nonfarm mortgages and real estate foreclosures	Nellie C. Hartke, Federal Home Loan Bank Board
Federal housing finance programs	Fordyce A. Voss, Department of Housing and Urban Development
FNMA purchases and sales	F. X. McGrath, Federal National Mortgage Association
Chapter P	
Corporate sales and profits	William Levin, Federal Trade Commission
Capital in manufacturing industries	Gerald F. Donahoe and John C. Musgrave, Bureau of Economic Analysis
Concentration in manufacturing	Willis K. Jordan, Bureau of the Census
Alcohol and tobacco products	Rex D. Davis, Internal Revenue Service
Rayon, acetate, and noncellulosic yarns	Stanley B. Hunt, Textile Economics Bureau, Inc.
Refined petroleum products	William G. Carrico and Charles Hennig, Bureau of Mines
Steel	Kenneth C. Allen and Robert Platt, American Iron and Steel Institute
Chapter Q	
Road mileage and Federal-aid highway system	Robert Sherrer, Federal Highway Administration
Chapter Q—Con.	
State highway finances	Helen C. Millson, Federal Highway Administration
Road and highway funds	David Sacks, Federal Highway Administration
Motor vehicle factory sales	Jacques J. Evers, Automobile Manufacturers Association, Inc.
Motor vehicle registrations and fuel	Alexander French and Laurence L. Liston, Federal Highway Administration
Travel mileage of motor vehicles	W. J. Page, Federal Highway Administration
Motor vehicle deaths and death rates	Barbara Carraro, National Safety Council
Public transit	Robert C. Stark, American Transit Association
Railroad mileage, equipment, traffic, finances	William F. Betts, Association of American Railroads
Railroad passenger and freight operations	William G. Norris, Interstate Commerce Commission
New passenger train cars	John L. Dale, Association of American Railroads
Railroad employment and wages	Joseph A. Edwards and Charles N. Graham, Interstate Commerce Commission
Employment and wage scale, merchant vessels	Lester E. Bartholow and Esther M. Love, Maritime Administration
Documented vessels	Robert O. McDonald, Coast Guard
Documented vessels on Western rivers	Erik F. Haites, University of Western Ontario, and Gary M. Walton, Indiana University
Waterborne cargo tonnage	W. A. C. Connelly, Corps of Engineers
Great Lakes traffic	Oliver T. Burnham, Lake Carriers' Association
Panama Canal traffic	F. R. Johnson, Panama Canal Co.
Aircraft production	Gene P. King, Federal Aviation Administration
Chapter R	
Telephone and telegraph	T. F. Finn, American Telephone and Telegraph Co.; Courtney S. Snyder, U.S. Independent Telephone Association; and Robert E. Stromberg, Federal Communications Commission
Radio and TV stations, finances, employment	Larry D. Eads, Federal Communications Commission

Appendix: Contributors to This Edition—Con.

Subject	Contributor
Chapter R—Con.	
Radio and TV sets produced	Horace L. Johnson, Electronic Industries Association
Families with radio and TV sets	Richard Ravich, National Broadcasting Co., Inc.
Radio and TV advertising	Patrick J. Kelly, Decker Communications, Inc.
Safety and special radio stations	Bertie E. Hislop, Federal Communications Commission
Postal service	Arthur H. Klotz, Jr., and J. R. Runyon, U.S. Postal Service
Books published	Frederico Fico and Isabel Pang, R. R. Bowker Co.
Newsprint and newspapers	Albert Weis, Editor and Publisher
Chapter S	
General review	Milton F. Searl, Resources for the Future, Inc.
Horsepower of all prime movers	John A. Waring, Takoma Park, Maryland
Electric energy and generating plants	Paul Hayes and Annetta R. McMillin, Federal Power Commission
Electric energy use	C. W. Lines, Federal Power Commission
Rural electrification program	Marvin T. Hearst, Rural Electrification Administration
Waterpower	T. A. Phillips, Federal Power Commission
Chapter T	
Department store sales and stocks indexes	Jerrie Ledson, Board of Governors of the Federal Reserve System
Retail trade margins	D. Anne Fisher, Bureau of Economic Analysis
Service establishments and receipts	John R. Wikoff, Bureau of the Census
Advertising indexes	Robert J. Coen, McCann-Erickson, Inc.
Newspaper advertising linage	Bernice Bowman, Bureau of Economic Analysis
Chapter U	
Balance of payments	Evelyn M. Parrish, Bureau of Economic Analysis
U.S. international investment position	Nancy R. Keith, Bureau of Economic Analysis
Investment in foreign countries	Julius N. Friedlen, Bureau of Economic Analysis
U.S. foreign grants and credits	E. Seymour Kerber, Bureau of Economic Analysis
Chapter U—Con.	
Foreign trade related to production	Herbert H. Glantz, Bureau of International Commerce
Value of exports, imports, and duties	Jeremiah N. King and Lala B. Pipkin, Bureau of the Census
Indexes of exports and imports	Seymour Etkin, Bureau of International Commerce
Chapter V	
Business concerns and failures	Rowena Wyant, Dun & Bradstreet, Inc.
Business formations index	Betty F. Tunstall, Bureau of Economic Analysis
Mergers in manufacturing and mining	Mary Ann Comps, Federal Trade Commission
Corporate finances	Hazel Beatty, Internal Revenue Service
Nonfinancial corporations, gross product and unit costs	John A. Gorman, Bureau of Economic Analysis
Finances of utility industries	Joseph P. Kucharski, Federal Power Commission
Chapter W	
National productivity indexes and real gross private product	Shelby A. Herman, Bureau of Economic Analysis
Indexes of output per manhour	Ed Henneberger and Arthur S. Herman, Bureau of Labor Statistics
Copyright registrations	Donald S. Reines, Copyright Office
Patents	Ethan A. Hurd, Patent Office
Research and development	Robert O. Santos, National Science Foundation
Chapter X	
Changes in gold stock	Margaret Garber, Board of Governors of the Federal Reserve System
Money market rates	Elizabeth Sette, Board of Governors of the Federal Reserve System
Bond and stock yields	Leo V. Barry, Jr., Bureau of Economic Analysis
Corporate securities	Robert H. Menke, Securities and Exchange Commission
New York Stock Exchange sales	George S. Morrissey and George Troester, Commercial and Financial Chronicle
Commercial and nonnational banks, assets and liabilities	Benjamin Christopher, Federal Deposit Insurance Corporation
Commercial banks	Loree D. Bernard, Betty Jean Johnson, and Bessie McCrea, Board of Governors of the Federal Reserve System

Appendix: Contributors to This Edition—Con.

Subject	Contributor
Chapter X—Con.	
National banks, earnings and expenses	David C. Motter and Irving Ward, Comptroller of the Currency
Federal Reserve Banks, assets and liabilities	Adrian P. Francoeur, Board of Governors of the Federal Reserve System
Federal Reserve member bank reserves	Dorothy Werner, Board of Governors of the Federal Reserve System
Credit unions	Herman Nickerson, Jr., and Vincent J. Olive, National Credit Union Administration
Life insurance in force	Ilene Freidus and Rosemarie Shomstein, Institute of Life Insurance
Property and liability insurance	Robert J. Schrader and William Steurer, Alfred M. Best Co.
Health insurance	Marjorie S. Mueller, Social Security Administration
Chapter Y	
Vote cast for Representatives	W. Pat Jennings, Office of the Clerk, House of Representatives
Campaign expenditures	Herbert Alexander, Citizens Research Foundation
Federal civilian employment	Christine Steele, Civil Service Commission
State and local government employment	Gerald Storch, Bureau of Labor Statistics
Corporate income, estate, and gift taxes	Lloyd K. Gilmour, Internal Revenue Service
Individual income tax returns	Floyd Reeves, Internal Revenue Service
Chapter Y—Con.	
Individual income tax liability	Gabriel G. Rudney, Department of the Treasury
Outlays of the Federal Government	Matthew J. Conroy, Office of Management and Budget
Federal grants	Alfred M. Skolnik, Social Security Administration
Armed Forces characteristics	John L. Donnelly, Department of Defense
Selective service registrants	Phyllis G. Knowles, Selective Service System
Defendants charged with Selective Service Act violations	Sam G. Moy, Administrative Office of the United States Courts
Veterans population	Millard Klein, Veterans Administration
VA expenditures for veterans benefits	Paul Kamenick, Veterans Administration
Chapter Z	
Slave imports	W. Robert Higgins, Murray State University
Slave prices	Richard N. Bean, University of Houston
Components of private wealth	Alice Hanson Jones, Washington University
Trade between England and Colonies	John J. McCusker, University of Maryland
Export-import values	James F. Shepherd, Whitman College, and Gary M. Walton, Indiana University
Tobacco prices	Carville Earle, University of Maryland, and Russell R. Menard, Annapolis, Maryland

Time Period Index

Before 1900

[Entries are series numbers. Each statistical series has been allocated to the time period for which the earliest figure in the series appears. For most series, an entry for a given time period means that the figures are presented for that and all later time periods]

A

Accession rates, manufacturing *160*, 181, 182
Accession, territorial, U.S. *423*, 428
Accidental death and dismemberment, insurance plan *334*, 343, 344
Accidents and fatalities (*see also* Injuries and fatalities):
Accidental falls, death rate 58
Air transportation *767*, 774
By industry groups *160*, *161*, 182
Casualties, war 1140
Deaths and death rates *47*, *48*, 49, 57–63
Motor vehicle 58, 719, 720
Railroad *726*, 739, 740
Accountants and auditors 140
Acetate and rayon yarn *662*, *665*, 691, 692, 697, 698
Acidulated scrap, fisheries industry *552*, 563
Acreage. *See* Farms *and* Land.
Actors and actresses 140
Acts, congressional *1069*, *1070*, 1081, 1082
Additions and alterations, residential *610*, *611*, *613*, 618, 620, 622

Admissions:
Excise taxes *1092*, 1107
Hospital *70*, 80, 81
Medical care, by war 1140
Recreation, expenditures for *395*, 401
Statehood 38
Adventist, Seventh-Day *390*, 391, 392
Advertising *838*, 839, 854–857
Agents and salesmen 142
Radio and television *793*, *794*, 797, 798
Afghanistan, U.S. grants and credits 873, 874
AFL *157–159*, 176, 177
Africa:
Arrivals and departures 119, 120
Colonial trade 1182–1184
Immigration from *99*, 109
Passports for 403
Shipping, colonial 1180, 1181
Slave trade *1155*, 1172–1174, 1182, 1183
Trade with U.S. 903–907
U.S. grants and credits 872–875
U.S. population born in 117, 118

Age:
Birth rates, by age of mother *45*, 50–52
Death rates 60–63
Farm operators *451*, 465
Fertility rates *45*, *46*, 50, 51, 53, 54
Illiteracy *365*, 382
Immigrants *100*, 112
Income, by age of male family head 303
Labor force 131–133, 134
Life expectancy *47*, 56
Population *4*, 10, 15–21, 23–37, 43
Colonial times 1169–1171
Residential structures *634*, 644, 645
Retired workers, OASDHI benefits 351
School enrollment *361*, *362*, 370–372
Years of school completed *364*, 380, 381

Agents 141
Agents and brokers, wholesale trade 852
Aggravated assault *408*, 413
Aggregate payments, distribution *221*, 238
Agriculture (*see also* Crops, Farms, *and individual products*):
Balance sheet, farming sector *471*, *472*, 480
Books published *803*, 808
Capital stock, value 259–262
Censuses in 1784 *1156*, 1175
Credit agencies, loans outstanding *478*, *479*, 492
Doctorates *367*, 387
Farmer cooperatives *455*, *456*, 470
Federal expenditures 1116
Federal loans, insurance, stock purchases 1048, 1049
Foreign investments 870
Freight traffic *725*, 732, 733
Gainful workers 138
Income and finances *471–479*, 480–492
Income, national 238

International investments 870
Labor force 127, 128, 139
Land:
Component of national wealth *246*, 252, 255, 256
Drainage and irrigation *427*, 433
Farm *246*, 252, 255, 256
Utilization *426*, 433
Loans, Federal *1044*, *1045*, 1048, 1049
Loans, non-real-estate *478*, *479*, 492

Agriculture—Con.
Machinery:
Capital in manufactures 684, 685
Employees 143
On farms *451*, *455*, 457, 469
Personal saving *249*, 262
Persons engaged in 240
Prices, farm *503*, *504*, 510–525
Farm-to-retail price spreads *476*, 489
Production expenses *473*, *474*, 484
Products, Federal sales 1122
Pupils enrolled 377
Research and development 966
Scientists 967
Stock purchases *1045*, 1048
Unemployment rate 136
Value added 239
Value of raw materials *493*, *494*, 497
Vocational programs 378
Wages:
Farmworkers 304, 305
Maryland, 1638–1676 *1166*, 1196
Philadelphia, 1785–1830 *147*, 163
Wholesale price indexes 199–203, 205

Agriculture, Department of:
Construction cost indexes *616*, 627, 628
Outlays 1114
Research and development 966

Agriculture, forestry, and fisheries:
Component of GNP 233
Corporate finances 932
Corporations, number 914
Employee earnings *149*, *150*, 166
Input-output transactions 272–283
National income 239
Unincorporated enterprises 915
Wage supplements 174
Aid programs, public assistance *333*, 356, 357
Foreign aid *862*, *863*, 872–875
Air and other transport, expenditures for 942, 1121, 1124, 1128
Air carriers, revenues 708
Air Force, Department of the:
Expenditures 1114
Personnel *1135*, 1140, 1141
Research and development 966

Air transportation *767*, 768–774
Accidents and fatalities *767*, 774
Aircraft *767*, 768–774
Airlines:
Output indexes *946*, 951, 952
Revenues and expenses 770, 771
Airports and landing fields *767*, 772, 773
Domestic and international *767*, 769, 770
Employment *703*, 708, *767*, 769, 770
Mileage 707, 709, *767*, 772–774
Pilots *767*, 772
Air-conditioners, shipments 694, 695
Aircraft *767*, 768–774
Equipment, expenditures for 942
Horsepower *811*, 818
Manufacturing, employees 143
Operators 769, 770
Output for domestic consumption 702
Research and development 966
Airlines:
Output indexes *946*, 951, 952
Revenues and expenses 770, 771

Airmail, domestic *802*, *803*, 806, 807
Airplane pilots and navigators 140
Airplanes, capital in manufactures 484, 485
Airports and landing fields *767*, 772
Airways, intercity traffic 707
Alabama. *See* State data.
Alaska (*see also* State data):
Acquisition and area 428
Fish catch *551*, 555, 557, 558
Population, pre-Statehood 9
Albania, U.S. population born in 117, 118
Alcoholic beverages (*see also* Liquors):
Consumer expenditures 316–321, 323, 325
Production 461, 689, 691
Taxes *1091*, 1107, 1108
Government revenue from 1121, 1122, 1129, 1130
Algebra, pupils enrolled 377
Algeria, U.S. grants and credits 873, 875

Aliens:
Admissions and departures *100*, *101*, 113
Definition *97*, *98*
Departing 119

Page

Aliens—Con.
Emigrant and nonemigrant *98*
Estate tax returns, Federal 1118
Excluded and deported *101*, 114
Immigrants *97*, *101*, 105–113
Naturalized *101*, *102*, 114–116
Nonimmigrants *100*, *101*, 113
Quota *100*, 113
Aluminum *577*, 605
Output per man-hour 951
Production capacity 697, 698, 764, 765
America:
Foreign trade 903–907
Immigrants *99*, 107, 108
American Appraisal Co., construction cost indexes *616*, 627, 628
American Colonies. *See* Colonial statistics.
American Federation of Labor (AFL) *157–159*, 176, 177
American League baseball attendance 399, 400
American Party, presidential votes 1073, 1074
American ports, colonial trade, coal 1184
American Revolution *1135*, 1140
American Samoa:
Accession date and area 428
Population 9
Ammonia, output 791, 792

Amusements (*see also* Recreation):
National income, origin in 839
Personal consumption expenditures *395*, 401
Persons engaged and earnings 840, 841
Services, establishments and receipts 854, 855
Anchors, colonial trade 1188
Anchovies, production and value *552*, 562
Animal fats and oils, exports 898
Animal food (fish), production and value 562
Animals, domestic:
Carload shipments 732, 733
Grazing on public lands *425*, 431, 432
Horsepower of work animals 818
Prices, production, value *506*, *507*, 519–521
Slaughtered *506*, *507*, 520, 521
Anthracite (*see also* Coal) *571*, 572, 592, 593
Earnings *150*, 166
Production and consumption *571*, 587, 588
Retail price indexes *196*, 214
Value *565*, 582, 583
Wholesale prices *190*, 207–209

Anthropology, sociology, doctorates 388
Anti-Jackson Party, presidential votes 1074
Anti-Masonic Party, presidential votes 1074
Apartments, hotels, and office buildings, cost indexes *616*, 627, 628

Apparel and related products:
Capital in manufacturing 784
Concentration in manufacturing 787
Consumer price indexes 210, 211
Consumption expenditures 316–327
Employment 141, 144, 145
Inventories, retail 842
Labor union membership 178
Manufactures, summary *655*, 671
Output *661*, 689, 690
Production indexes 669
Retail trade 844, 846, 848, 849

Appeals courts *411*, 417, 418
Apples, consumption 329, 330
Appliances:
Electrical, wholesale trade 851
Household, value of output 700
Applied research *961*, 967
Apportionment, House of Representatives *1*, *1069*, *1070*, 1084, 1085
Apprentices, by occupation 143
Architects 140

Area:
Forest land *526*, 533, 536
Area burned *527*, 537
Land, United States *2*, *5*, 8, 38, 39, *423*, 428
Outlying areas *423*, 428
Parks *393*, *394*, 396–399
Public domain *423*, 428
Recreational areas, national 397
States *5*, 38, 39
Territories 38, 39
United States *2*, *5*, 8, 38, 39, *423*, 428
Water, inland *5*, 428

Argentina, U.S. grants and credits 873, 875

SUBJECT INDEX

[Numbers in *italics* refer to text pages]

Page

Individuals—Con.
Income:
Median ... *287*, 296, 297
Wages and salaries ... 304, 305
Taxes:
Collections ... *1090*, *1091*, 1107
Liabilities, exemptions, rates ... *1094*, *1095*, 1111, 1112
Returns ... *1093*, *1094*, 1110
Revenue from ... 1105, 1119, 1121, 1122, 1125, 1126, 1129, 1133
Mortgage loans ... 649
Number with money income ... 289–291
Patents issued ... *954*, *955*, 957, 958
Saving ... *250*, *251*, 264–266

Indonesia, U.S. grants and credits ... 873, 875
Indoor recreation centers ... 398, 399
Industrial:
Buildings, construction ... *611*, 618–621
Bidding volume ... *614*, *615*, 626
Contracts awarded ... 624, 625
Communication (radio) ... 799, 800
Electric energy use ... *815*, 828
Establishments:
Electric energy production ... *812*, *813*, 820, 821
Fuel consumption ... *812*, 819
Installed generating capacity ... *813*, 822–825
Injury-frequency rates ... *160*, *161*, 182
Life insurance ... *1053*, 1056, 1057
Machinery and equipment, output ... 701
Natural gas use ... *816*, 831, 832
Origin of national income ... *222*, 239
Price indexes ... 199
Research and development ... *963*, *964*, 966, 967
Stock prices and yields ... *997*, 1003, 1004
Subjects, pupils enrolled ... 377
Supplies, foreign trade ... *880*, *881*, 895
Water use and wells ... 434

Industries:
Capital in manufacturing ... 684, 685
Daily hours and wages ... *154*, *155*, 173
Earnings ... *149–155*, 165–173
Employment ... *125*, 137–139
Input-output transactions ... 272–283
Labor force ... 139
National income ... *222*, 239
Persons engaged in ... 240
Plant and equipment expenditures ... 942
Research and development ... *963*, *964*, 965–967
Unemployment rates ... 136
Union membership ... *159*, 178
Value added by manufacture ... *653*, *654*, 669–680
Wage supplements ... *155*, 174
Work injury frequency rates ... *160*, *161*, 182
Work stoppages ... 180, 181
Infant mortality ... *47*, 57, 60–63
Infantile paralysis (poliomyelitis) ... 77
Infants. *See* Vital statistics.

Influenza and pneumonia, death rate ... 58
Inheritance taxes ... 1113
Injuries and fatalities (*see also* Accidents, *etc.*):
Manufacturing, mining, railroads ... *160*, *161*, 182
Mineral industries ... *578*, 606, 607
Inland water area ... 428
Inland waterways, freight traffic ... 707
Input-output structure ... *268–271*, 272–283
Inspectors ... 141, 142
Installed generating capacity ... *813*, 822–825
Installment credit, consumer ... 978, 979
By type ... *1000*, 1009
Institutional care, welfare expenditures ... 340, 341
Institutional mortgage debt ... *636*, *637*, 647, 648
Institutional population ... 7, 43
Institutional structures, value ... 252, 255, 256
Institutions:
Criminal ... *411*, *412*, 420–422
Educational. *See* Education.
For mentally retarded ... *71*, *72*, 85
Health. *See* Hospitals.

Instruments and related products:
Concentration in manufacturing ... 687
Manufactures, summary ... *656*, 680
Production indexes ... 667, 668
Insurance ... *1050–1055*, 1056–1066
Agents and brokers ... 142
Automobile ... 717
Benefits and repayments, government ... 1119, 1120, 1123, 1127, 1130, 1132

Page

Personal income—Con.
Geographic distribution ... 242–245
Per capita ... *217*, 225
Relation to GNP ... *220*, 234

Personal loans ... *1000*, 1009
Personal outlays ... 234, 242, 978
Personal saving ... 978
Relation to GNP ... 234
Personal services (*see also* Service industries):
Earnings ... *150*, 167, 840, 841
Employees ... 141, 144, 145
Establishments, receipts ... 854
Expenditures, government ... 1119, 1120, 1123, 1127, 1130, 1132
Gainful workers ... 138
National income, origin in ... 839
Personal tax and nontax payments ... 234
Personnel and labor relations workers ... 141
Persons arrested ... *409*, 415
Persons, by income levels ... *284–287*, 298
Persons engaged in production, by industry ... 240
Manufacturing industries ... *653*, 666
Persons with job, not at work ... *124*, 136
Peru, U.S. grants and credits ... 873, 875
Petroleum and natural gas, summary ... *564*, 580
Employees and man-hours ... *579*, 608, 609
Mining, input-output transactions ... 272–283

Petroleum and products (*see also* Gas):
Capital in manufactures ... 684, 685
Concentration in manufacturing ... 687
Crude:
Consumption in manufacturing ... 688
Foreign trade, value, production, reserves ... *572*, 593, 594
Production and consumption ... *568*, 587, 588
Production capacity ... *665*, 697, 698
Employees ... 144, 145
Exports and imports ... *573*, 597, 898, 900, 901
Gases, production and value ... *572*, 594
Input and output at refineries ... *573*, 596
Input-output transactions ... 272–283
International investments ... 871, 872
Manufactures, summary ... *655*, 675
Output, public lands ... 432
Pipeline construction ... *611*, 618, 620, 621
Plant and equipment expenditures ... 942
Production indexes ... 668, *946*, 950–952
Products:
Refined, output ... *662*, 691, 692
Waterborne traffic ... 763
Refining, output per man-hour ... 950
Research and development ... 966
Value ... *565*, 582, 583
Wholesale trade ... 852

Petroleum refining, output per man-hour ... 950
Pharmacists ... 140
Philadelphia:
Colonial shipping ... 1181
Coal exports and imports ... 1184
Communication rates ... 784, 790
Wage rates ... *147*, 163
Wholesale price indexes ... *187*, *188*, 205, 206
Wholesale prices, colonial times ... *1166*, 1197
Philanthropy ... *339*, 359
National health expenditures ... 74
Philippines:
Accession date and area ... 428
Immigration from ... 107, 108
Population ... *4*, 9
U.S. grants and credits ... 873, 875

Philosophy, psychology books published ... *803*, 808
Phonographs shipped ... 695, 696
Phosphate rock:
Sales, exports ... *574*, 597, 598
Value ... *566*, 583, 584
Phosphatic fertilizers, production capacity ... *665*, 697, 698
Photoengravers ... 142
Photographers ... 140
Photographic equipment and supplies, workers ... 143, 145
Photographic process workers ... 143
Photographic studios ... 839, 854
Physical education, pupils enrolled ... 377
Physical-structure materials, consumption ... *812*, 818, 819

Physicians:
Consumer expenditures ... 316–319
Earnings ... *156*, 175, 176
Fees, indexes ... 75
Health insurance benefits ... 1066
Immigrants ... 75, 76
Number ... *67*, *68*, 75, 76, 140
Services, national expenditures for ... *65*, 73
Physicists ... 967
Physics, physiology, pupils enrolled ... 377
Piano and organ tuners ... 142
Pianos produced ... 697
Pickup balers on farms ... 469
Pig iron ... *574*, *575*, 599, 600
Pigs. *See* Hogs.
Pilots, airplane ... 772

Pine:
Colonial exports ... 1184
Lumber, prices and production ... 543, 547

Page

Pipelines (*see also* Oil pipelines):
Construction ... *611*, 618, 620, 621
Output per worker ... *946*, 951, 952
Pitch:
Colonial exports ... 1184, 1194
Wholesale prices, Philadelphia, 1720–1775 ... 1197
Places, urban and rural ... *2*, *3*, 11
Plant and equipment value, by industry ... *922*, 940
Business expenditures for ... 942
Plant (education), operation and maintenance ... *367*, 384
Plasterers ... 142
Playgrounds ... 398, 399
Pleasure craft, output ... 701
Plumbers and pipefitters ... 142
Plumbing fixtures, wholesale price indexes ... 629, 630
Plymouth, colonial population ... 1168
Plywood ... *528*, *529*, *532*, 539, 540, 548
Wholesale price indexes ... 629, 630

Pneumatic tires, production ... 692, 693
Poetry, drama books published ... *803*, 808
Poland:
Immigration from ... *98*, 105, 106
Population originating in ... *103*, *104*, 116–118
U.S. grants and credits ... 873, 874
Police officers killed ... 415
Police protection expenditures ... *409*, 416, 1120, 1124, 1127, 1128, 1131, 1132, 1134
Policemen and detectives ... 144
Poliomyelitis ... 77
Political parties:
Congress, affiliations ... *1070*, 1073–1081
Presidential votes ... 1073–1081
Representative votes ... 1084

Political science, doctorates ... 388
Poplar, yellow, lumber production ... 543
Popular vote cast for President ... *1069*, 1073, 1074, 1077–1080
Population (*see also* Negro population *and* Minority races), total ... 8, 9
Abroad ... 9
Age:
Distribution ... 10, 15–21, 23–37
Institutional ... 43
Household head ... 42
Median ... *4*, 19
Alien. *See* Aliens.
Apportionment per Representative ... *1070*, 1084, 1085
Born at sea ... 117, 118
Chinese ... *3*, 14
Citizenship ... *103*, 116
Civilian ... 8
Colonial ... *1152–1164*, 1168–1171
Color. *See* Population, race.
